# Summit Agenda

| Time (MT)           | Topic  | Speakers                                     |
|---------------------|--|--|
| 9:15 – 9:30 AM      | Introduction to the MMRF   | Mary DeRome, MS                              |
| 9:30 – 9:45 AM      | Welcome  | Joan Koerber-Walker, CEO, AzBio              |
| 9:45 – 10:15 AM     | Newly Diagnosed Multiple Myeloma: Diagnosis and Induction Therapy                              | P. Leif Bergsagel, MD                        |
| 10:15 – 10:45 AM    | High-Dose Chemotherapy and Stem Cell Transplantation, Maintenance Therapy, and Treatment Goals | Clarence Adoo, MD                            |
| 10:45 – 11:00 AM    | Break  |  |
| 11:00 – 11:30 AM    | Supportive Care  |  |
| 11:30 AM – 12:00 PM | Personalized Medicine  | Jonathan Keats, PhD                          |
| 12:00 – 12:30 PM    | Relapsed/Refractory Multiple Myeloma   | Sumit Madan, MD                              |
| 12:30 – 1:15 PM     | Lunch  |  |
| 1:15 – 1:30 PM      | Patient and Caregiver Speakers   | Moderator: Suzanne Hyde, MSW, LCSW           |
| 1:30 – 2:30 PM      | Arizona Myeloma Network Virtual Cancer Caregiver's Education Program                           | William Brown<br>Suzanne Hyde, MSW, LCSW     |
| 2:30 – 3:30 PM      | Town Hall Q&A  | Panel  |
| 3:30 – 3:45 PM      | Closing Remarks  | Barbara and Jack Kavanagh<br>Mary DeRome, MS |

5

## MMRF Introduction

Mary DeRome, MS  
MMRF

6

# The Work of the MMRF

The MMRF does three things in relentless pursuit of its mission to accelerate a cure for each and every myeloma patient.

1

## We accelerate new treatments

Bringing next-generation therapies to patients faster

2

## We drive precision medicine

Using data to deliver better answers and more precise treatments for patients

3

## We empower patients

Putting them on The Right Track and guiding them to the right team, tests, and treatments to extend their lives

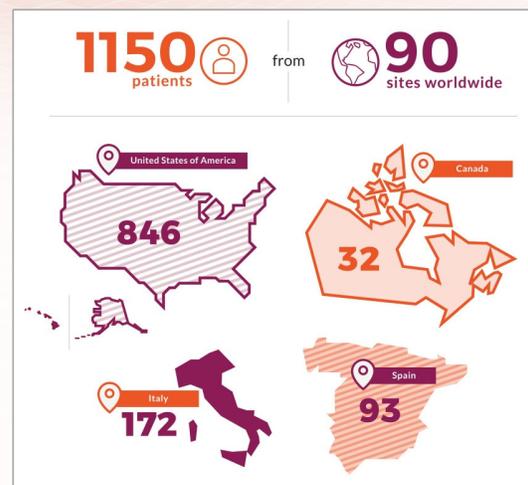

7

# MMRF CoMMpass Study: Advancing Personalized Medicine Research

- Landmark study focusing on the genomics of myeloma
- Goals
  - Learn which patients respond best to which therapies
  - Identify new targets and new hypotheses
- Newly diagnosed patients are followed for at least 8 years

All participants undergo a type of detailed DNA testing called **genomic sequencing** at diagnosis and each relapse.

8

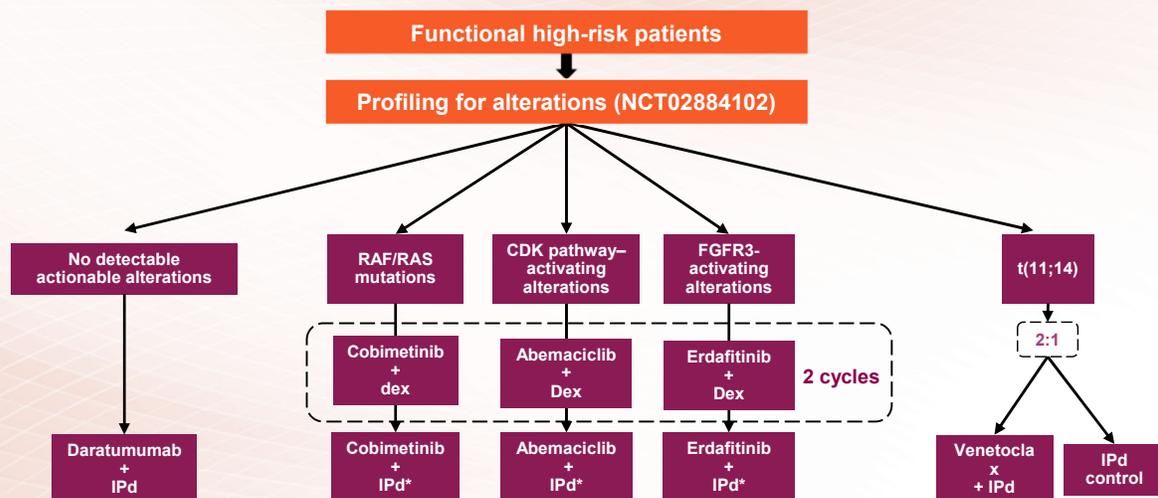

# CoMMpass Is a Trial of Discovery

- CoMMpass data has
  - Provided the myeloma community with information on
    - Frequency of genetic abnormalities
    - How genetic abnormalities play a role in myeloma
      - Drive multiple myeloma cell growth and survival
      - Contribute to drug resistance
      - May predict which patients respond to which therapy
    - Genetic abnormalities that help refine risk assessment
  - Led to conception of the MyDRUG trial and CureCloud Research Study

9

# MyDRUG Trial

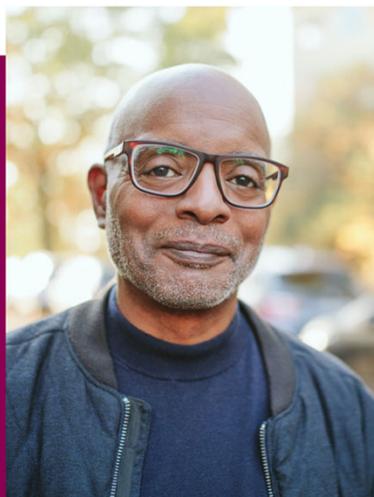

\*Assess single-agent activity after 2 cycles: after cycle 2, add backbone to single agent

10

## MMRF CureCloud

### Driving toward smarter treatment options

Introducing the MMRF CureCloud® – a research study that includes the first at-home genomic testing program for multiple myeloma patients. Our goal is to accelerate research toward smarter treatment options for every patient.

Join the MMRF CureCloud

11

## MMRF CureCloud *Recent Changes*

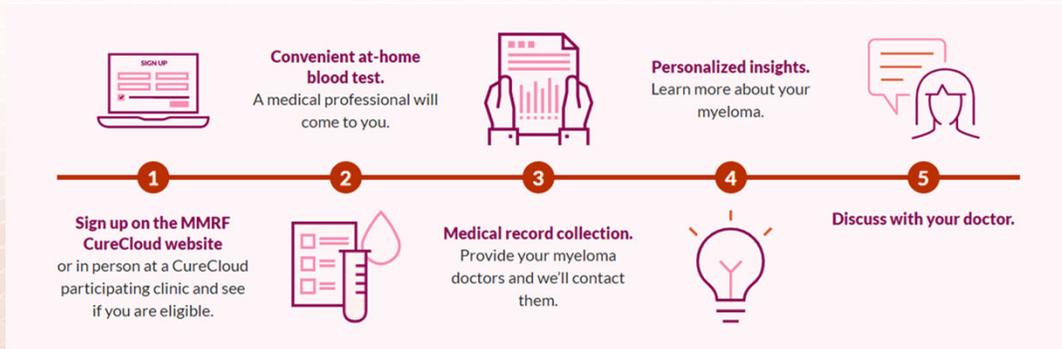

- A new and better assay is being developed to look at patient DNA data from myeloma cells in their blood sample. While this assay is being developed, patients who join will no longer be able to receive their DNA test results, but their DNA will still be analyzed with the results placed in the CureCloud along with their clinical information
- Patients can sign up for CureCloud from home and will soon be able to enroll at select clinical sites with help from site research staff—sites in preparation include UTSW, WashU, Hackensack, Emory, Ochsner, Karmanos, and the VA. By the end of 2023, we anticipate that 15 sites will be approved for on-site enrollment
- For now, patients will still provide their blood samples using an at-home blood draw
- Patients who live in New York may now enroll in CureCloud
- We anticipate that patients will be able to receive their DNA results from samples collected sometime in 2024

12

# MMRF CureCloud

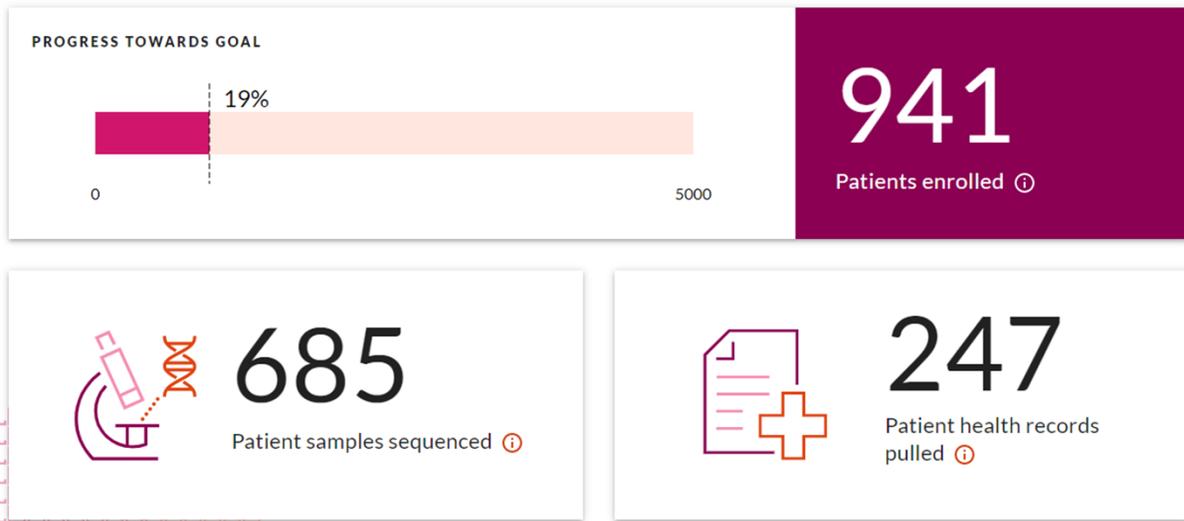

## How Does the MMRF CureCloud® Work?

13

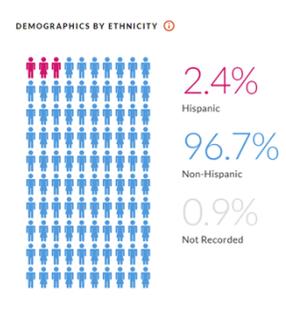

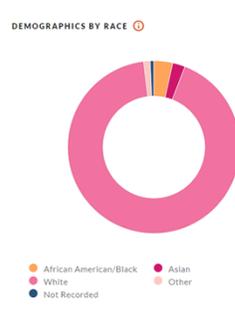

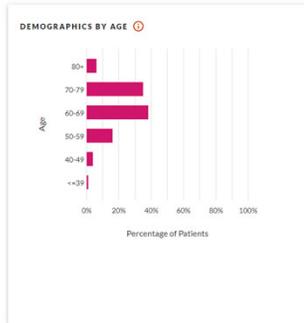

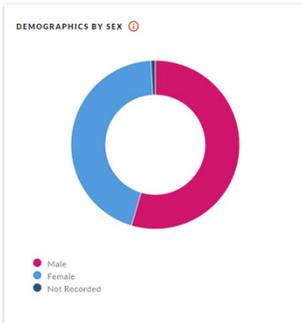

## CureCloud Enrollment Tracker

This is the total number of patients who have enrolled in the CureCloud study. Monitor enrollment progress as we work toward our goal of 5,000 patient participants over 5 years. Explore anonymous CureCloud patient data below and find more information about each section in the (i) icon.

16

## Question

Are you a...

- A. Patient
- B. Caregiver (family member or friend who helps patient manage his or her disease)
- C. Other

17

## Question

At what stage is your myeloma? (If you are a caregiver, what is the stage of the patient's myeloma?)

- A. Newly diagnosed
- B. Relapsed/refractory
- C. Remission: still on therapy
- D. Remission: not on therapy
- E. MGUS or smoldering myeloma not currently requiring treatment
- F. Other
- G. I don't know.

18

## Question

Have you had a stem cell transplant?

- A. No, but I will soon!
- B. No, but I am considering one (or my doctor is discussing with me).
- C. No, my doctor tells me I am not a candidate.
- D. Yes
- E. Not applicable

19

## Question

Do you know if you had any molecular characterization performed on your tumor, such as FISH, cytogenetics, or sequencing?

- A. No
- B. Yes, I had FISH.
- C. Yes, I had cytogenetics.
- D. Yes, I had sequencing.
- E. Yes, I had more than one of these tests performed.
- F. I don't know.

20

## Question

Is this your first Summit?

- A. Yes
- B. No

21

## Question

Have you and your care team ever discussed the possibility of you joining a clinical trial that you are eligible for? (If you are a caregiver, do you know if joining a clinical trial has ever been discussed?)

- A. Yes
- B. No
- C. I don't know.

22

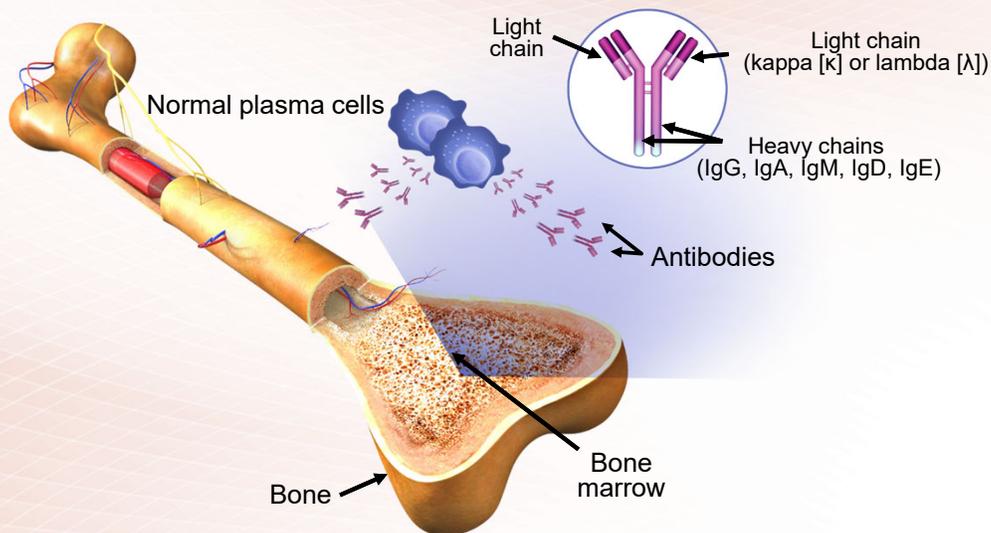

# Newly Diagnosed Multiple Myeloma: Diagnosis and Induction Therapy

**P. Leif Bergsagel, MD**  
Mayo Clinic College of Medicine  
Scottsdale, Arizona

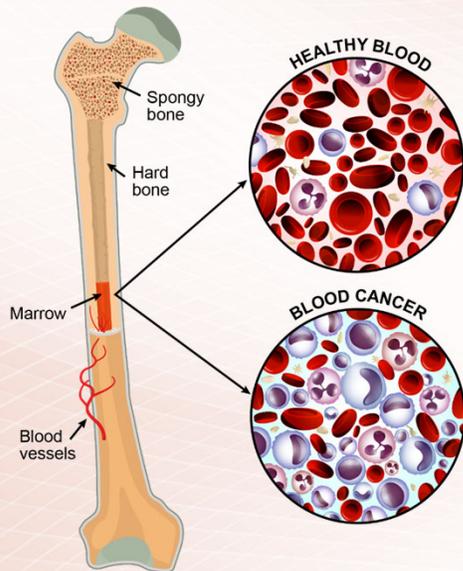

23

## Normal Bone Marrow

24

## What is multiple myeloma?

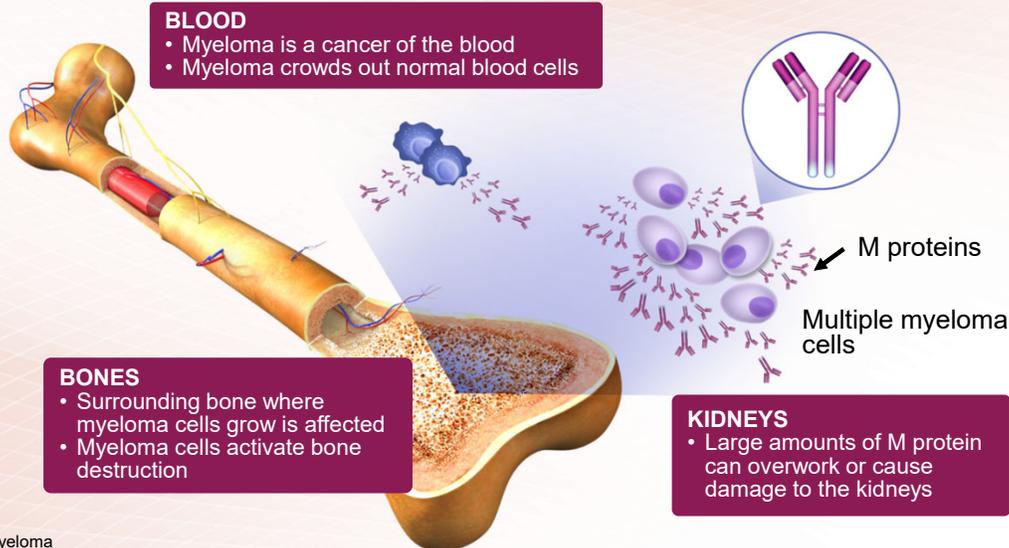

- Multiple myeloma is a **blood cancer** that starts in the **bone marrow**, the place where all **blood cells** are produced
- Multiple myeloma is caused when a type of **white blood cell** called a **plasma cell** becomes cancerous and grows out of control

25

## Multiple Myeloma Affects Your Bones, Blood, and Kidneys

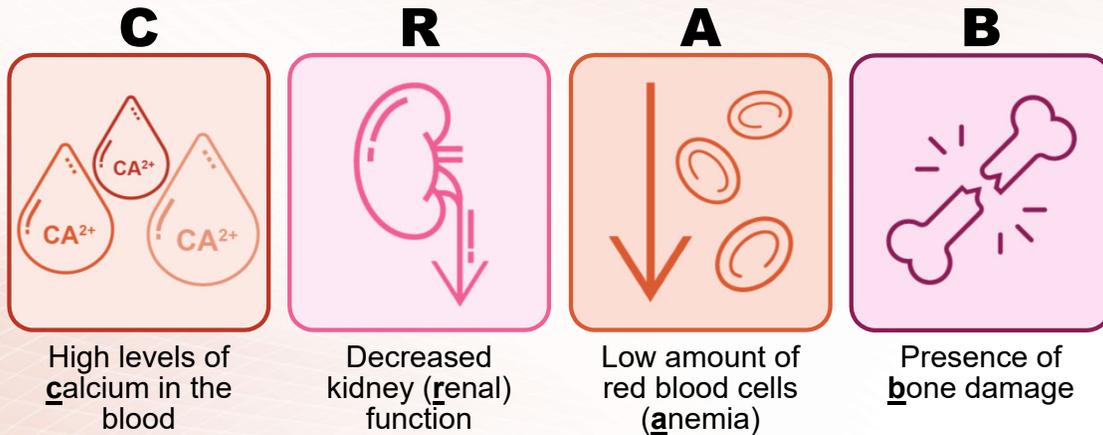

MM, multiple myeloma

26

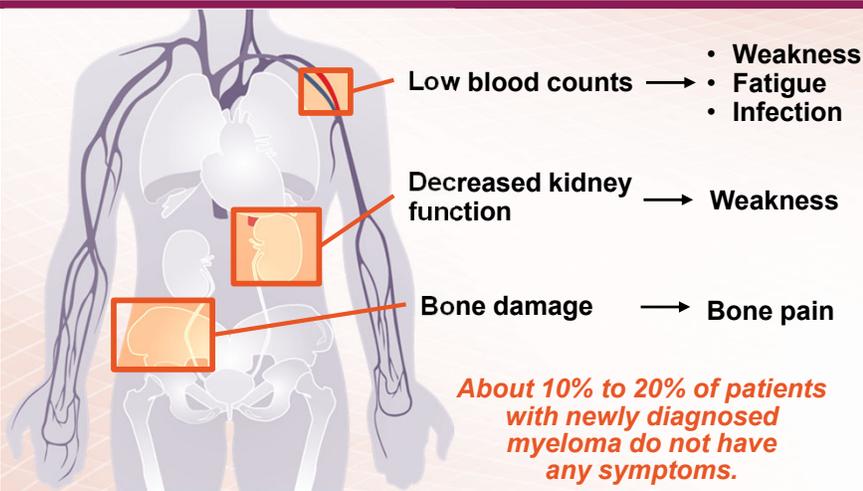

# Multiple Myeloma Affects Your Bones, Blood, and Kidneys

The clinical features that are characteristic of multiple myeloma

27

# Effects of Myeloma and Common Symptoms

Disease presentation and myeloma-related complications after myeloma diagnosis are different in patients by race

### More common in Black patients

- Hypercalcemia
- Kidney dysfunction
  - Hemodialysis
- Anemia

### Less common in Black patients

- Bone fractures

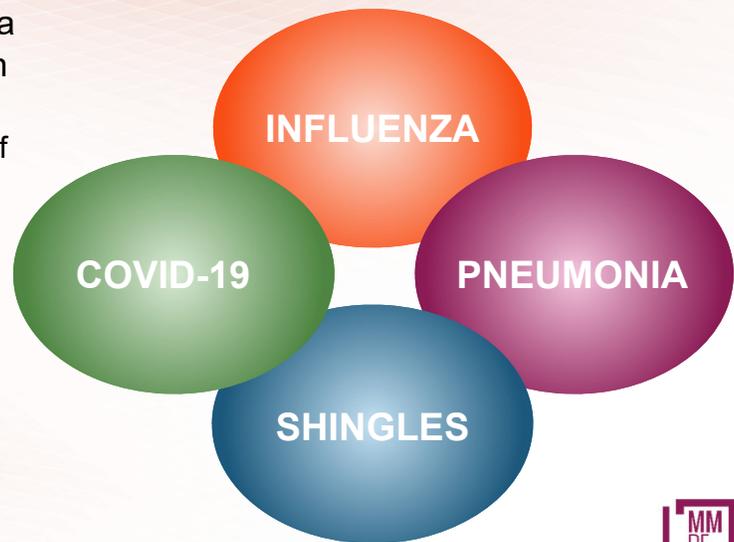

MMRF. Multiple myeloma symptoms, side effects, and complications. [themrf.org/multiple-myeloma/symptoms-side-effects-and-complications/](http://themrf.org/multiple-myeloma/symptoms-side-effects-and-complications/). Campbell K. *Nurs Times*. 2014;110:12; Kyle R et al. *Mayo Clin Proc*. 2003;78:21; Ailawadhi S et al. *Cancer*. 2018;124:1710.

28

## Infections and Vaccinations in Multiple Myeloma

- Risk of infection higher for myeloma patients than for general population
- Types of infections include
  - Bacterial: pneumonia (an infection of the lungs), bacteremia
  - Viral: varicella zoster (shingles), influenza, COVID
- Preventive strategies (prophylaxis) are recommended
  - Hand-washing, avoiding sick contacts
  - Vaccines/pre-exposure antibodies
  - Other precautions (antibiotics, growth factors)

29

## Demographic Risk Factors: Multiple Myeloma

- Older age
- Male sex
- Obesity
- Race
  - ↑ Blacks (2× Whites)
  - Ashkenazi Jews
  - Europe: Ireland
  - ↓ Asian

### Family history risks

One first-degree relative with multiple myeloma

Relatives of multiple myeloma patients have more monoclonal gammopathy of undetermined significance (MGUS)

Schinasi LH et al. *Br J Haematol.* 2016;175:87.  
Thordardottir M et al. *Blood Adv.* 2017;1:2186.

30

## Following the Proper Path Will Help Patients Get the Best Treatment and Results for Their Specific Type of Myeloma

### Right Team

Access experts and centers that have extensive experience treating multiple myeloma

### Right Tests

Get the information, tests and precise diagnoses to make the right treatment decisions

### Right Treatment

Work with your team to decide on the best treatment plan and identify clinical trials that are right for you

31

## The Right Team

### Available resources

Connect with a myeloma specialist—a doctor who diagnoses and treats a high number of myeloma patients

MMRF's online myeloma treatment locator: [themmrf.org/resources/find-a-treatment-center](https://themmrf.org/resources/find-a-treatment-center)

Seek a second opinion at any point in your journey

Contact the MMRF Patient Navigation Center: [themmrf.org/resources/patient-navigation-center](https://themmrf.org/resources/patient-navigation-center)  
1-888-841-MMRF (6673)

32

# The Right Tests

## Common laboratory tests conducted

### Blood tests

- Complete blood count
- Complete metabolic panel
- Chemistries
  - Calcium
  - Creatinine
  - Lactate dehydrogenase
  - Beta-2 microglobulin
- Serum protein electrophoresis with immunofixation electrophoresis (IFE)
- Serum free light chain assay

Confirms the type of myeloma

### Urine tests

- Urine protein electrophoresis with IFE
- 24-hour urine

### Bone marrow biopsy

- Conventional
- Fluorescence in situ hybridization (FISH)
- New
- Genomic sequencing

Determines how advanced the myeloma is and identifies the myeloma subtype

### Imaging tests

- X-ray
- MRI
- Whole-body, low-dose CT scan
- PET scan
- Metastatic bone survey

Assess changes in the bone structure and determine the number and size of tumors in the bone

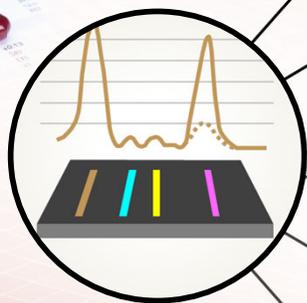

Detects the extent of bone disease and the presence of myeloma outside of the bone marrow

33

# Learn Your Labs! Blood Tests

## Blood tests

**CBC**

- Number of red blood cells, white blood cells, and platelets

**CMP**

- Measure levels of albumin, calcium, lactate dehydrogenase (LDH), blood urea nitrogen (BUN), and creatinine. Assess function of kidney, liver, and bone status and the extent of disease

**B2M**

- Determine the level of a protein that indicates the presence/extent of MM and kidney function

**SPEP**

- Detect the presence and level of M protein

**IFE**

- Identify the type of abnormal antibody proteins

**SFLC**

- FreeLite test measures light chains (kappa or lambda)

CBC, complete blood count; CMP, complete metabolic panel; B2M; beta-2 microglobulin; SPEP, serum protein electrophoresis; IFE, immunofixation electrophoresis; SFLC, serum free light chain assay

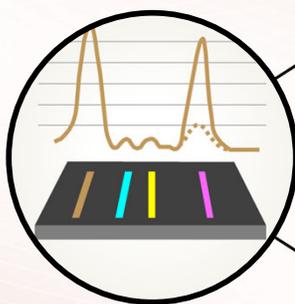

34

## Learn Your Labs! Urine Tests

### Urine tests

UPEP

24-hr urine analysis

- Detect Bence Jones proteins (otherwise known as myeloma light chains)

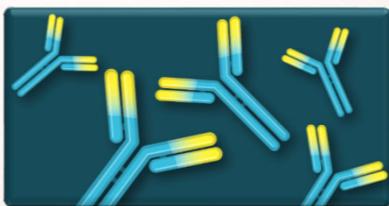

- Determine the presence and levels of M protein and Bence Jones protein

UPEP, urine protein electrophoresis

35

## Types of Multiple Myeloma Based on Blood or Urine Tests

### Intact M protein

- Named for the type of immunoglobulin and light chain pair; for example, IgG kappa ( $\kappa$ ) or IgG lambda ( $\lambda$ )

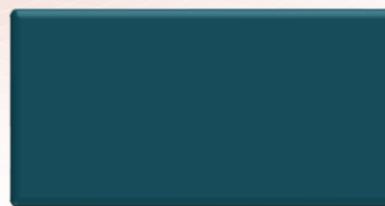

80%

### Light chain only

- Also known as Bence Jones protein
- Renal failure more common in light chain multiple myeloma

20%

### Non-secretory

- No M protein present

3%

36

# Know Your Imaging Tests!

Assess changes in the bone structure and determine the number and size of tumors in the bone

**X-ray**

Conventional x-rays reveal lytic lesions, osteoporosis, or fractures in 75% of patients.

**MRI**

**CT scan**

**PET scan**

MRI and PET/CT appear to be more sensitive (85%) than skeletal x-rays for the detection of small lytic bone lesions.

37

# Know Your Bone Marrow Tests!

**Bone marrow aspiration and biopsy**

Jamshidi needle

Bone marrow

Hip bone

Skin

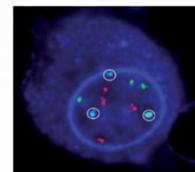

Myeloma cell

Chromosome

DNA

Karyotyping

FISH (fluorescence in situ hybridization)

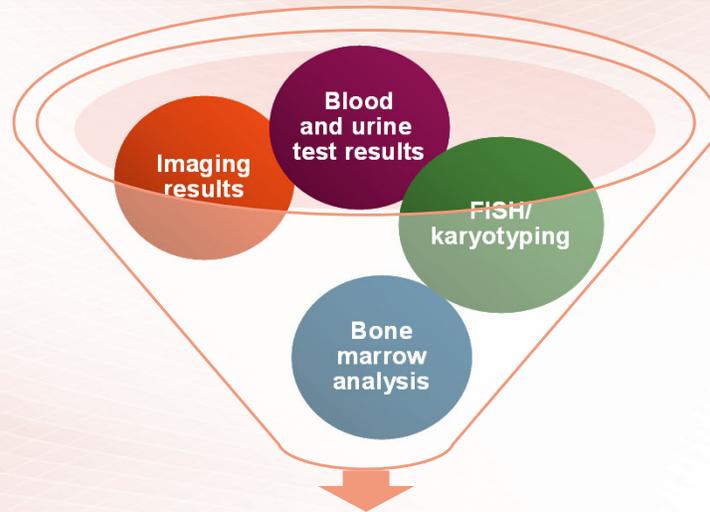

Genomic sequencing

38

# Putting the Results Together

Staging, prognosis, and risk assessment

39

# Multiple Myeloma Prognosis and Risk

## Revised International Staging System (R-ISS)

| R-ISS stage | Laboratory measurements  |
|-------------|--|
| I           | <ul style="list-style-type: none"> <li>Serum <math>\beta</math>2M level &lt;3.5 mg/L</li> <li>Serum albumin level <math>\geq</math>3.5 g/dL</li> <li>No high-risk CA*</li> <li>Normal LDH level</li> </ul> |
| II          | All other possible combinations  |
| III         | <ul style="list-style-type: none"> <li>Serum <math>\beta</math>2M level <math>\geq</math>5.5 mg/L</li> <li>High-risk CA* or high LDH level</li> </ul>  |

\*High-risk chromosomal abnormality (CA) by FISH: del(17p) and/or t(4;14) and/or t(14;16)

## Mayo Stratification of Myeloma and Risk-Adapted Therapy (mSMART) Consensus Guidelines

### High risk

- High-risk genetic abnormalities
  - t(4;14)
  - t(14;16)
  - t(14;20)
  - del 17p
  - p53 mutation
  - gain 1q
- R-ISS Stage 3
- High plasma cell S phase
- GEP: high-risk signature

- Double-hit myeloma:** any two high-risk genetic abnormalities
- Triple-hit myeloma:** three or more high-risk genetic abnormalities

### Standard risk

- All others including:
  - Trisomies
  - t(11;14)
  - t(6;14)

Currently cannot identify with great certainty all high-risk patients.

$\beta$ 2M; beta-2 microglobulin; LDH, lactate dehydrogenase; GEP, gene-expression profiling

Greipp PR et al. *J Clin Oncol.* 2005;23:3412; Palumbo A et al. *J Clin Oncol.* 2015;33:2863; Mikhael JR et al. *Mayo Clin Proc.* 2013;88:360.

40

# Multiple Myeloma Prognosis and Risk

Many blood test and bone marrow biopsy test results can determine a patient's risk for myeloma that is aggressive (high risk) or not (standard risk) based on the Revised International Staging System (R-ISS)

## Standard risk

R-ISS  
Stage I

- Serum  $\beta$ 2M level <3.5 mg/L
- Serum albumin level  $\geq$ 3.5 g/dL
- No high-risk chromosomal abnormality\*
- Normal LDH level

All other possible combinations of the test results means that a patient is **R-ISS stage II**

## High risk

R-ISS  
Stage III

- Serum  $\beta$ 2M level  $\geq$ 5.5 mg/L
- High-risk chromosomal abnormality\* or high LDH level

\*High-risk chromosomal abnormality by FISH: del(17p) and/or t(4;14) and/or t(14;16)  
 $\beta$ 2M; beta-2 microglobulin; LDH, lactate dehydrogenase; FISH, fluorescent in situ hybridization

41

# The Right Treatment

Know the treatment options available to you based on your myeloma subtype at each stage of your disease.

Be aware of the pros and cons of each option.

Clearly communicate your treatment goals and concerns to the care team.

Find clinical trials that are right for you.

42

## Getting the Right Treatment: Goals of Multiple Myeloma Therapy

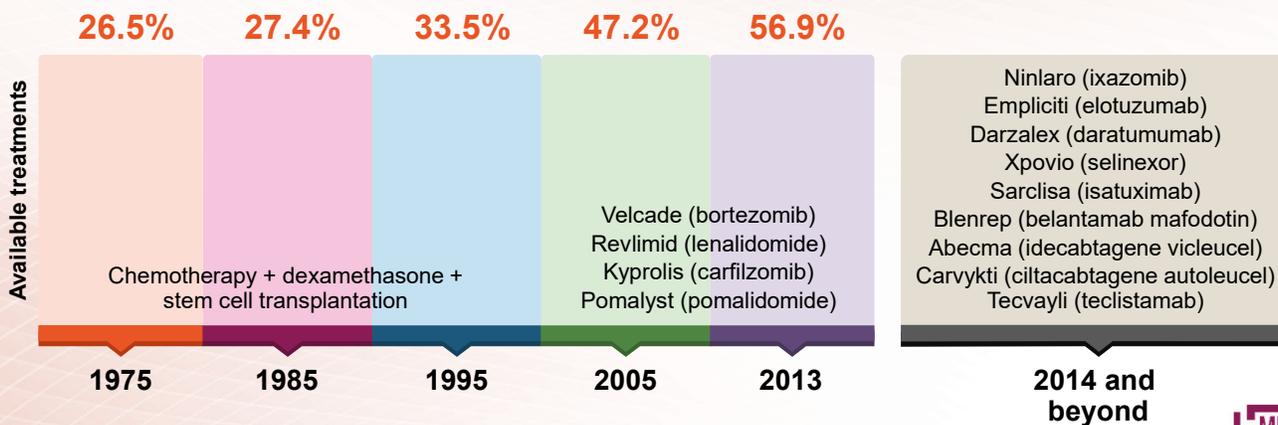

-  Reduce the amount of M protein (as measured by serum protein electrophoresis) or light chains (as measured via the free light chain test) to the lowest level possible.
-  Eliminate myeloma cells from the bone marrow (as measured via minimal residual disease [MRD] testing).
-  Improve quality of life with as few treatment side effects as possible.
-  Provide the longest possible period of response before first relapse.
-  Prolong overall survival.

43

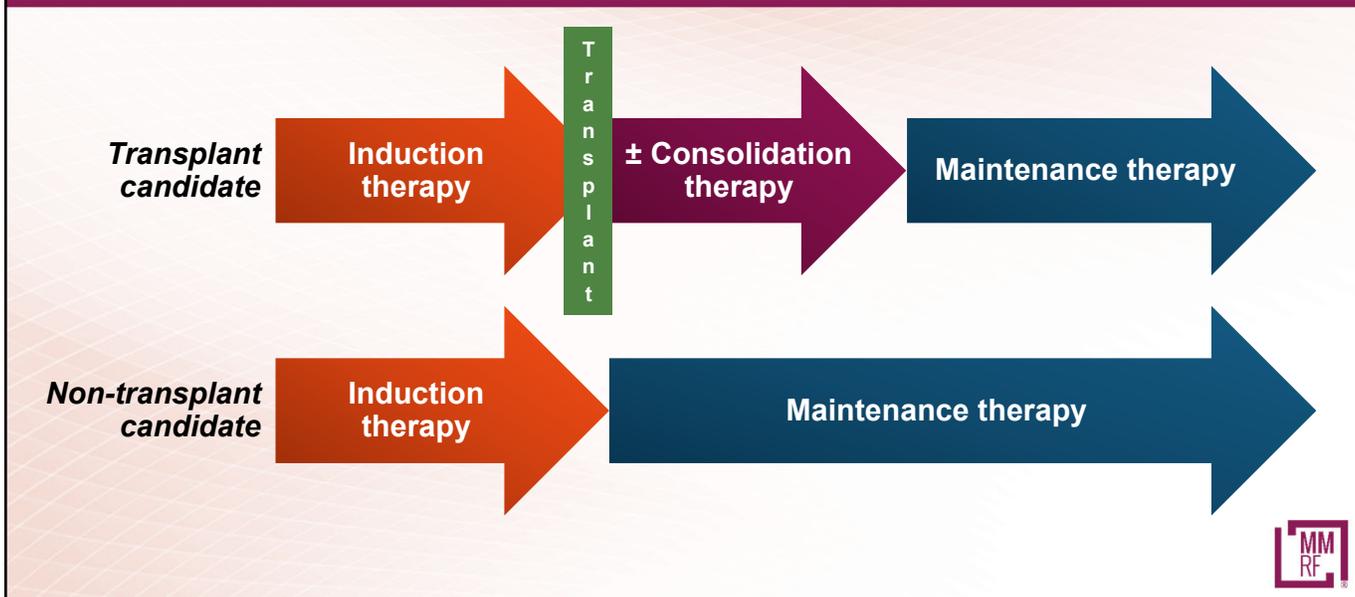

## Myeloma Survival Has Improved Over Time Mainly Due to Current Drugs

The percentage of people expected to survive 5 years or more after being diagnosed with myeloma

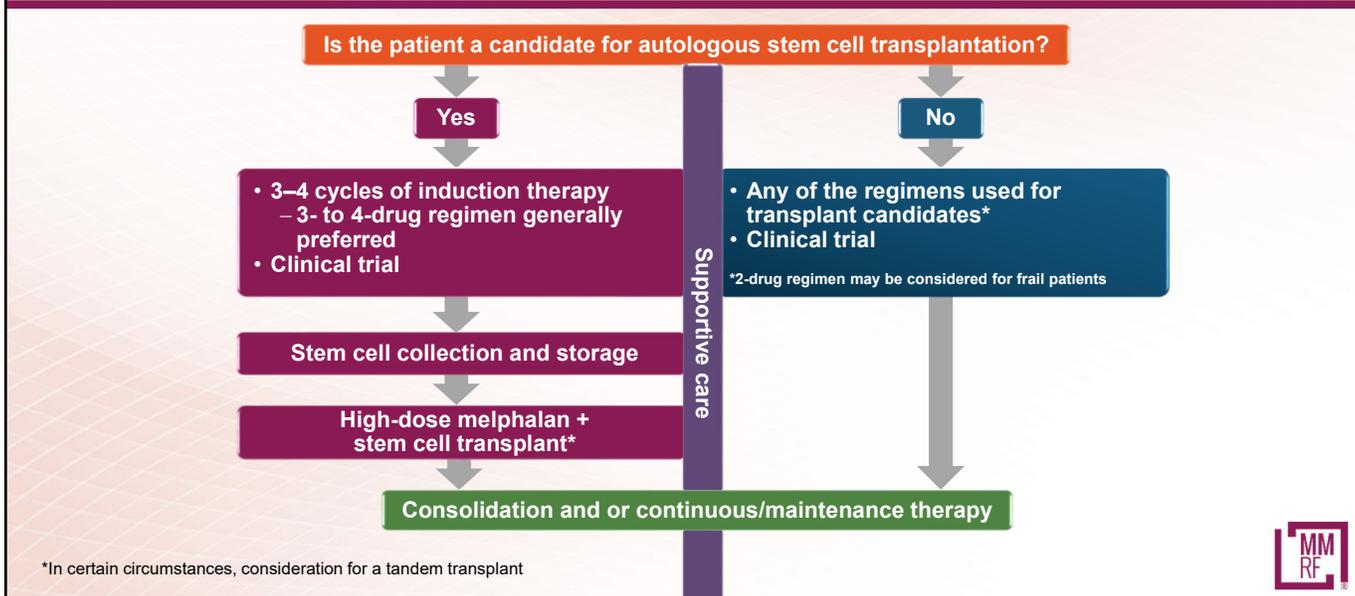

44

## Current Treatment Paradigm for Newly Diagnosed Multiple Myeloma

45

## Overview of Treatment Approach for Active Multiple Myeloma

\*In certain circumstances, consideration for a tandem transplant

46

# Induction Therapy Regimens

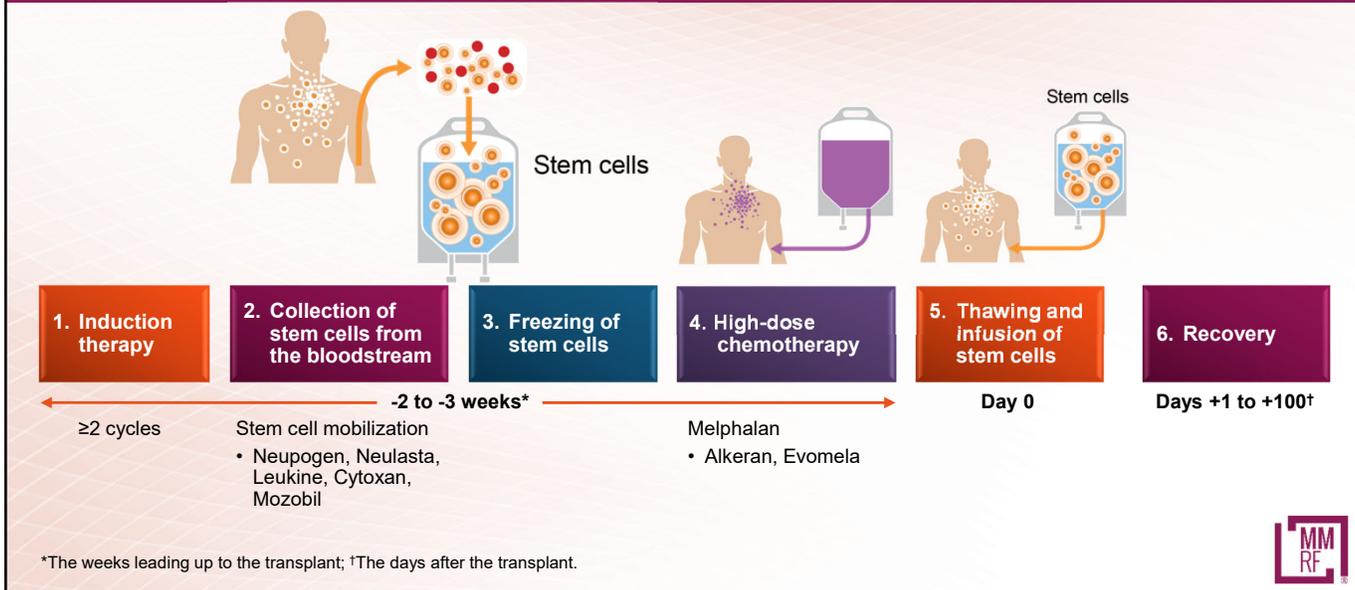

|                       | Preferred   | Recommended   | Certain circumstances   |
|-----------------------|---|---|---|
| Transplant eligible   | <ul style="list-style-type: none"> <li>• Revlimid-Velcade-dex (RVd)*</li> <li>• Kyprolis-Revlimid-dex (KRd)</li> </ul>  | <ul style="list-style-type: none"> <li>• Darzalex-Revlimid-Velcade-dex (D-RVd)</li> </ul>   | <ul style="list-style-type: none"> <li>• Velcade-Thalomid-dex (VTd)*</li> <li>• Velcade-Cytoxan-dex (VCd)</li> <li>• Velcade-Doxil-dex (VDd)</li> <li>• Kyprolis-Cytoxan-dex (KCd)</li> <li>• Revlimid-Cytoxan-dex (RCd)</li> <li>• Darzalex-Velcade-Thalomid-dex (D-VTd)</li> <li>• Darzalex-Kyprolis-Revlimid-dex (D-KRd)</li> <li>• Darzalex-Cytoxan-Velcade-dex (D-VCd)</li> <li>• Ninlaro-Revlimid-dex (IRd)</li> <li>• Ninlaro-Cytoxan-dex (ICd)</li> <li>• VTD-PACE</li> </ul> |
| Transplant ineligible | <ul style="list-style-type: none"> <li>• Revlimid-Velcade-dex (RVd)*</li> <li>• Darzalex-Revlimid-dex (DRd)*</li> </ul> | <ul style="list-style-type: none"> <li>• Kyprolis-Revlimid-dex (KRd)</li> <li>• Ninlaro-Revlimid-dex (IRd)</li> <li>• Darzalex-Velcade-melphalan-prednisone (D-VMP)*</li> <li>• Darzalex-Cytoxan-Velcade-dex (D-VCd)</li> </ul> | <ul style="list-style-type: none"> <li>• Velcade-dex (Vd)</li> <li>• Revlimid-dex (Rd)*</li> <li>• Velcade-Cytoxan-dex (VCd)</li> <li>• Revlimid-Cytoxan-dex (RCd)</li> <li>• Kyprolis-Cytoxan-dex (KCd)</li> <li>• Revlimid-Velcade-dex (RVd)-lite</li> </ul>  |

\*Category 1 recommendation. Based on high-level evidence, there is uniform NCCN consensus that the intervention is appropriate.  
National Comprehensive Cancer Network Guidelines Version 3.2023. Multiple Myeloma.

47

# Autologous Stem Cell Transplantation

48

## Continuous or Maintenance Therapy Options

|                                | Preferred   | Recommended  | Certain circumstances   |
|--------------------------------|---|--|---|
| Transplant Transplant eligible | <ul style="list-style-type: none"> <li>• Revlimid*</li> </ul> | <ul style="list-style-type: none"> <li>• Ninlaro</li> <li>• Velcade</li> <li>• Darzalex</li> </ul> | <ul style="list-style-type: none"> <li>• Velcade-Revlimid ± dex</li> <li>• Kyprolis-Revlimid</li> </ul> |
| Transplant ineligible          | <ul style="list-style-type: none"> <li>• Revlimid*</li> </ul> | <ul style="list-style-type: none"> <li>• Ninlaro</li> <li>• Velcade</li> </ul>                     | <ul style="list-style-type: none"> <li>• Velcade-Revlimid</li> </ul>                                    |

\*Category 1 recommendation. Based on high-level evidence, there is uniform NCCN consensus that the intervention is appropriate.  
National Comprehensive Cancer Network Guidelines Version 3.2023. Multiple Myeloma.

49

## Measuring Response to Therapy

ClonoSEQ is an FDA-approved next-generation sequencing (NGS) test to measure MRD in MM patients.  
Palumbo A et al. *J Clin Oncol*. 2014;32:587.  
Kumar S et al. *Lancet Oncol*. 2016;17:e328.

50

## Where is the myeloma field going?

- Staging with genomics and advanced imaging
- Higher efficacy using four-drug regimens
- Precision medicine and targeted therapies in subsets of patients—for example, t(11;14)
- MRD-driven therapy
- Minimize long-term toxicities since myeloma patients living (much) longer
- New drug classes and immunotherapies

51

## Summary

- **Multiple myeloma is a rare blood cancer that can negatively affect the bones, kidneys, and the bone marrow, leading to lowered blood counts.**
- **The prognosis of multiple myeloma depends on the genetic makeup of myeloma cell chromosomes; R-ISS is used for staging in multiple myeloma.**
- **Survival rates are improving because of new drugs and new combinations of drugs.**
- **The treatment paradigm will continue to change with the approval of additional novel agents.**
- **Knowledge is power: right team, right test, right treatment.**

**Be an informed and empowered part of your health care team!**

52

**Please take a moment to  
answer two questions  
about this presentation.**

53

## **High-Dose Chemotherapy and Stem Cell Transplantation, Maintenance Therapy, and Treatment Goals**

---

**Clarence Adoo, MD**  
Arizona Center for Cancer Care  
Honor Health  
Glendale, Arizona

54

## Overview of Treatment Approach for Active Multiple Myeloma

Is the patient a candidate for autologous stem cell transplantation?

Yes

- 3–4 treatment cycles
- 3 or 4 drugs

Stem cell collection and storage

High-dose melphalan + stem cell transplant\*

maintenance treatment

No

- 6 or more treatment cycles
- 3 or 4 drugs.

\*In certain circumstances, consideration for a tandem transplant

55

## High-Dose Chemotherapy and Stem Cell Transplantation

- Remission lasts longer
- Can be done early on or later (or both)
- Most patients will qualify,
  - including older patients,
  - patients with kidney disease
  - Insurance coverage.

56

# What does transplant mean?

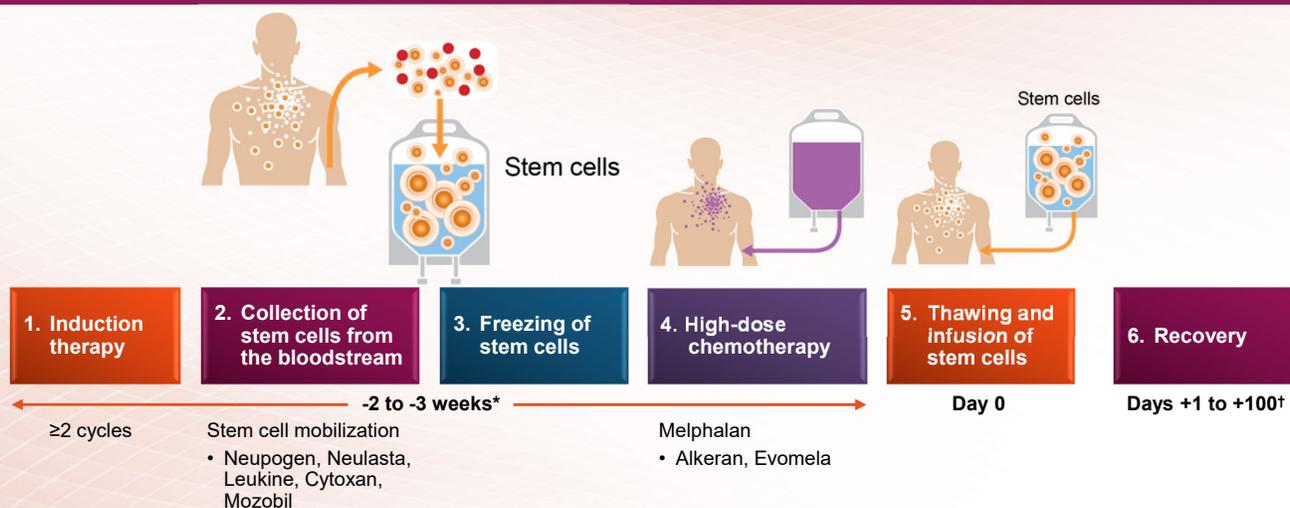

## Understanding the basics of autologous stem cell transplantation

- blood-forming cells collected from the patient's own blood  
 Stem cells are frozen and stored.
- Patient gets high dose chemotherapy: melphalan.  
 most myeloma cells are destroyed  
 some normal cells (hair follicles, taste buds and blood cells)  
 are also temporarily destroyed.
- The previously collected stem cells are given back by iv infusion.  
 Stem cells restore blood cells with fewer myeloma cells  
 Other cells like hair follicles and taste buds recover.

57

# Autologous Stem Cell Transplantation

\*The weeks leading up to the transplant; †The days after the transplant.

58

## Side Effects of High-Dose Chemotherapy

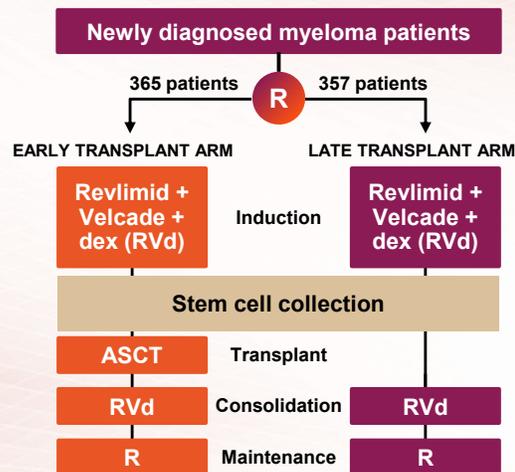

| Fatigue   | Nausea & vomiting  | Diarrhea   | Mucositis   | Low blood counts   |
|---|--|--|---|--|
| <ul style="list-style-type: none"> <li>Expected</li> <li>May last 1–3 months</li> </ul> | <ul style="list-style-type: none"> <li>Symptoms much more manageable with newer anti-emetics</li> <li>Try to prevent nausea</li> </ul> | <ul style="list-style-type: none"> <li>May include stomach cramping</li> <li>Encourage small amounts of food, more often</li> <li>Avoid milk, milk products, high-fiber foods</li> </ul> | <ul style="list-style-type: none"> <li>Pain, sores in mouth; sore throat</li> <li>Pain meds, mouth swishes</li> <li>Avoid tart, acidic, salty, spicy foods</li> <li>Soft food better tolerated</li> </ul> | <ul style="list-style-type: none"> <li>Low White blood cells count- risk for infection</li> <li>Hemoglobin drop. Fatigue</li> <li>Platelet count drop bleeding risk</li> <li>Blood transfusion</li> <li>Platelet transfusion</li> <li>antibiotics</li> <li>WBC and platelets recover in 2 weeks</li> </ul> |

59

## Transplant or 3-drug treatment?

Comparative trial of Transplant vs continued 3 drug treatment: DETERMINATION Trial

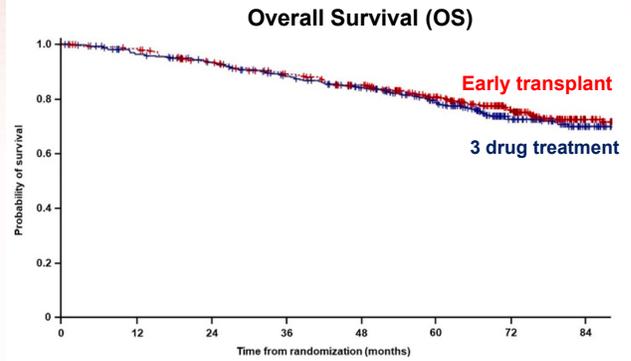

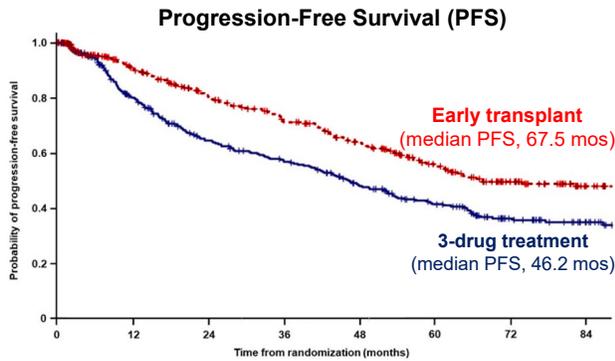

The study enrolled 19% Black myeloma patients.

Richardson PG et al. *N Engl J Med.* June 5, 2022 [Online ahead of print].

60

## Comparative Study of Early Transplant vs continuation of Bortezomib, Lenalidomide and dexamethasone.

PFS for early transplant: 5 and one half years  
 PFS for 3 drug treatment: 4 years.

Length of overall survival was same.

Transplant extended time to progression by 20 months

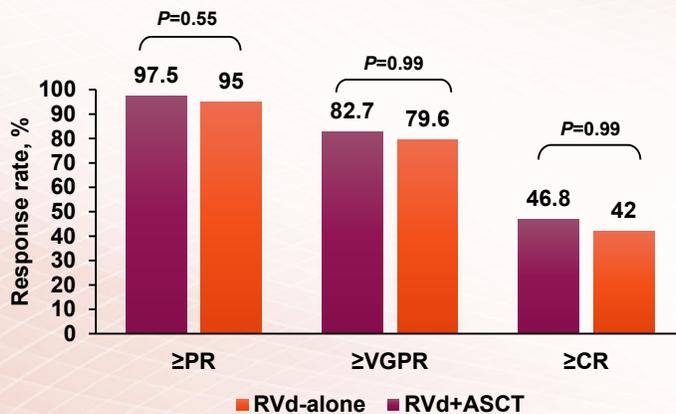

Richardson PG et al. *N Engl J Med.* June 5, 2022 [Online ahead of print].

61

## Comparative Study of Transplantation in Patients With Newly Diagnosed Multiple Myeloma

### Best Response to Treatment and Duration of Response

| Duration of response           | RVd alone (late transplant) | RVd + ASCT (early transplant) | P value |
|--------------------------------|-----------------------------|-------------------------------|---------|
| Median duration of ≥PR, months | 38.9                        | 56.4                          | 0.003*  |
| 5-year duration of ≥CR, %      | 52.9                        | 60.6                          | 0.698   |

Richardson PG et al. *N Engl J Med.* June 5, 2022 [Online ahead of print].

62

## Phase 3 Study of Early vs Late Autologous Stem Cell Transplantation in Patients With Newly Diagnosed Multiple Myeloma

| Side effect, %            | RVd-alone (N=357) | RVd+ASCT (N=365) |
|---------------------------|-------------------|------------------|
| Any                       | 78.2              | 94.2             |
| Blood count problems      | 60.5              | 89.9             |
| Fatal side effects        | 0.3               | 1.6 *            |
| Very low white cell count | 42.6              | 86.3             |
| Low platelet count        | 19.9              | 82.7             |
| Low white cell count      | 19.6              | 39.7             |
| Anemia                    | 18.2              | 29.6             |
| Lymphopenia               | 9.0               | 10.1             |
| Infections with low WBC   | 4.2               | 9.0              |
| Diarrhea                  | 3.9               | 4.9              |
| Nausea                    | 0.6               | 6.6              |
| Mouth sores               | 0                 | 5.2              |
| Fatigue                   | 2.8               | 6.0              |
| Fever                     | 2.0               | 5.2              |
| Pneumonia                 | 5.0               | 9.0              |
| Low phosphate             | 9.5               | 8.2              |
| numbness, tingling nerve  | 5.6               | 7.1              |

Severe side effects were more common with transplant.

\*Includes one death related to ASCT

## Subsequent Therapy and Rate of ASCT in RVD-ALONE Arm (Late ASCT)

| Subsequent therapy in patients off protocol therapy, % | RVd-alone (N=279) Late Transplant | RVd+ASCT (N=276) Early Transplant |
|--|-----------------------------------|-----------------------------------|
| Any treatment*   | 79.6                              | 69.6                              |
| <b>Subsequent therapy</b>                              | <b>n=222</b>                      | <b>n=192</b>                      |
| Any immunomodulatory drug                              | 55.9                              | 58.3                              |
| Pomalyst (pomalidomide)                                | 30.2                              | 29.2                              |
| Revlimid (lenalidomide)                                | 25.7                              | 29.2                              |
| Any proteasome inhibitor                               | 55.9                              | 50.0                              |
| Velcade (bortezomib)                                   | 27.5                              | 25.5                              |
| Kyprolis (carfilzomib)                                 | 21.2                              | 16.7                              |
| Ixazomib   | 8.1                               | 7.8                               |
| Marizomib  | 0                                 | 0.5                               |
| Any monoclonal antibody                                | 16.2                              | 27.6                              |
| Darzalex (daratumumab)                                 | 11.3                              | 21.4                              |
| Empliciti (elotuzumab)                                 | 4.5                               | 6.3                               |
| Sarclisa (isatuximab)                                  | 0.5                               | 0                                 |

\*Including IMiDs, PIs, mAbs, HDACi (panobinostat), ASCT, chemotherapy, RT, steroids, other

Richardson PG et al. *J Clin Oncol*. 2022;40. Abstract LBA4. Richardson PG et al. *N Engl J Med*. June 5, 2022 [Online ahead of print].

Only 28.0% of RVd-alone (late transplant) patients had received ASCT at any time following end of study treatment

66

## Early vs Delayed Transplant Pros and Cons

### Pros

#### Early ASCT

- Youngest you are going to be
- Healthiest you are going to be
- Allows for fewer cycles of initial treatment
- Deeper and more durable response

#### Delayed ASCT

- Conserve quality of life in the early part of disease journey
- PFS may be shorter with delayed (vs early) hematopoietic cell transplantation (HCT), but OS is the same
- Better drugs or treatments could be available later on

### Cons

#### Early ASCT

- 20% of patients still relapse within 2 years
- 1% risk of serious life-threatening complications
- 3 months of full clinical recovery
- No proven impact on overall survival

#### Delayed ASCT

- 60%–70% of patients will relapse and may need it as salvage
- Not all patients relapsing are able to undergo salvage HCT
- May need longer duration of chemotherapy to replace its effects

67

## What is maintenance therapy?

A prolonged, and often low-dose, treatment given to myeloma patients after achieving a desired response to initial therapy

To prevent disease progression for as long as possible while maintaining favorable quality of life

To deepen responses by reducing minimal residual disease (MRD) or maintaining the response achieved, reduce the risk of relapse, and prolong survival

68

## Successful Maintenance Therapy Must...

|                                      |   |   |
|--------------------------------------|---|---|
| <p><b>1</b></p> <p>Be convenient</p> | <p><b>2</b></p> <p>Be safe and well tolerated long term</p> | <p><b>3</b></p> <p>Not interfere with the use of other future treatments<br/>                 Not obscure disease measurement</p> |
|--------------------------------------|---|---|

69

## Continuous or Maintenance Therapy Options

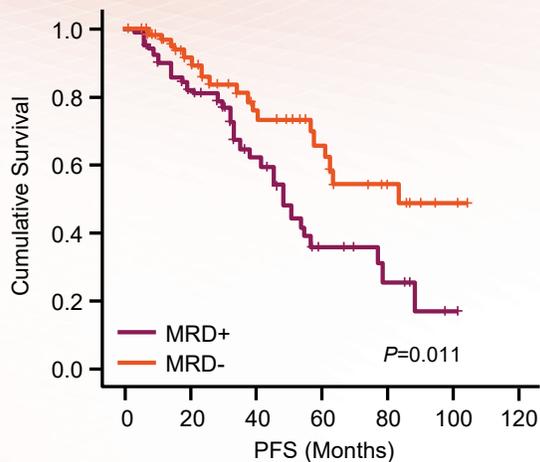

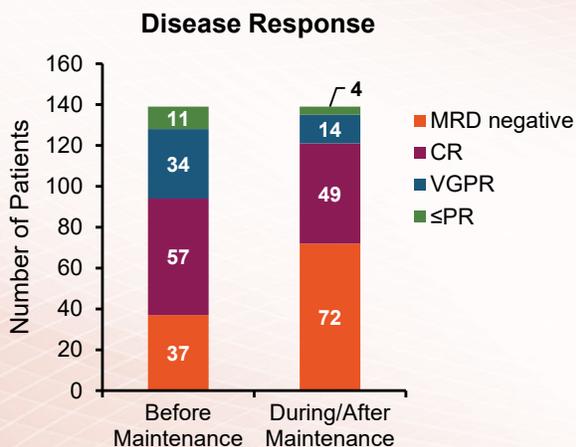

|                       | Preferred   | Recommended  | Certain circumstances   |
|-----------------------|---|--|---|
| Transplant eligible   | <ul style="list-style-type: none"> <li>• Revlimid*</li> </ul> | <ul style="list-style-type: none"> <li>• Velcade</li> <li>• Darzalex</li> <li>• Ninlaro</li> </ul> | <ul style="list-style-type: none"> <li>• Velcade-Revlimid ± dex</li> <li>• Kyprolis-Revlimid</li> </ul> |
| Transplant ineligible | <ul style="list-style-type: none"> <li>• Revlimid*</li> </ul> | <ul style="list-style-type: none"> <li>• Velcade</li> <li>• Ninlaro</li> </ul>                     | <ul style="list-style-type: none"> <li>• Velcade-Revlimid</li> </ul>                                    |

\*Category 1 recommendation. Based on high-level evidence, there is uniform NCCN consensus that the intervention is appropriate.  
 National Comprehensive Cancer Network Guidelines Version 2.2023. Multiple Myeloma.

70

## Revlimid Maintenance Therapy: Improves Depth of Response

At maximal response during or after maintenance treatment with Revlimid

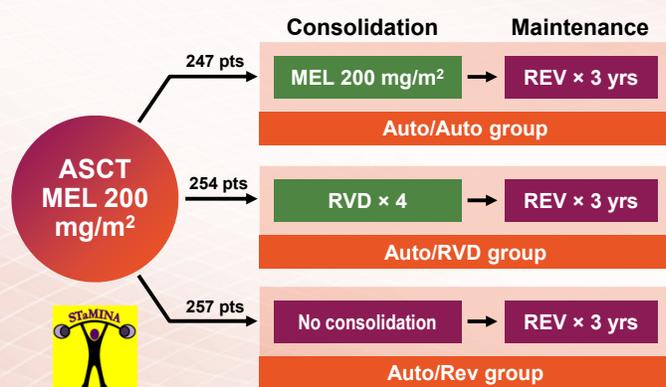

Alonso R et al. *Blood Adv.* 2020;4:2163.

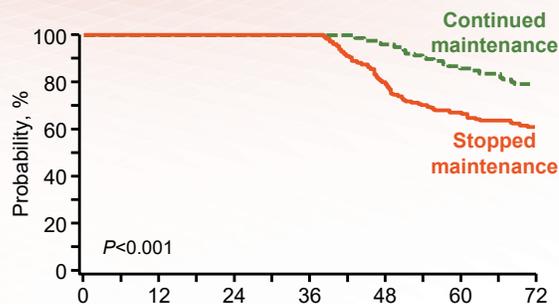

71

## Revlimid Maintenance Duration

### STAMINA Trial (BMT-CTN0702)

There was no difference in PFS or OS between the 3 groups

Discontinuation of Revlimid @ 3 years did not impact overall second primary malignancies (SPM) rates @ 6 years

Discontinuation of Revlimid maintenance at 3 years is not recommended because of the increased risk of disease progression

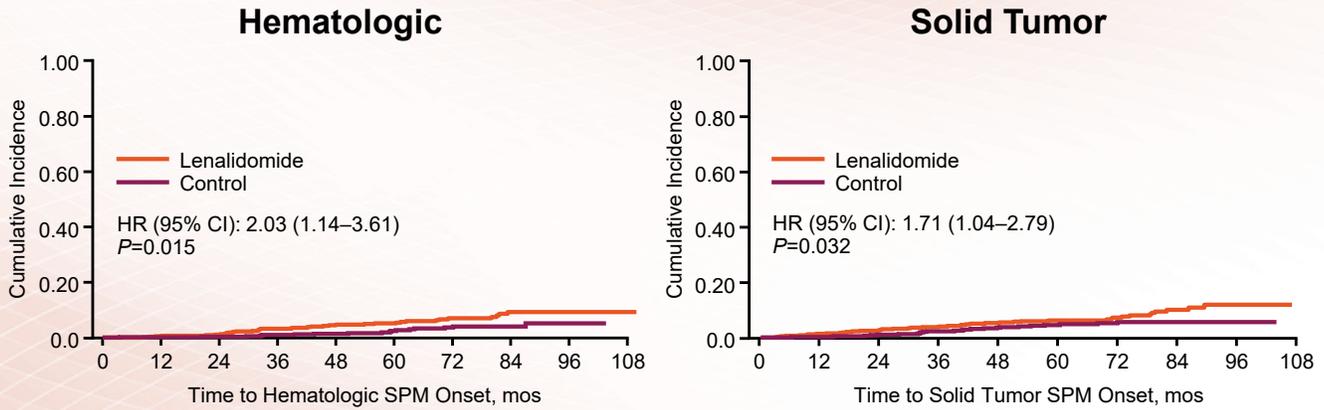

MEL, melphalan; RVD, Revlimid-Velcade-dex; REV, Revlimid

STAMINA Trial. Stadtmauer EA et al. *J Clin Oncol.* 2019;37:589; Hari P et al. *J Clin Oncol.* 2020;38. Abstract 8506.

72

## Revlimid Maintenance: Cumulative Incidence of Second Primary Malignancies

McCarthy PL et al. *J Clin Oncol*. 2017;35:3279.

73

## Minimal Residual Disease Negativity as a Multiple Myeloma Treatment Goal

74

## Goals of Multiple Myeloma Therapy

- 
- Reduce the amount of M protein (as measured by serum protein electrophoresis) or light chains (as measured via the free light chain test) to the lowest level possible
  - Eliminate myeloma cells from the bone marrow (as measured via minimal residual disease [MRD] testing)
  - Improve quality of life with as few treatment side effects as possible
  - Provide the longest possible period of response before first relapse
  - Prolong overall survival

75

## Measuring Response to Therapy

ClonoSEQ is an FDA-approved next-generation sequencing (NGS) test to measure MRD in MM patients  
Palumbo A et al. *J Clin Oncol*. 2014;32:587.  
Kumar S et al. *Lancet Oncol*. 2016;17:e328.

76

## What is MRD?

The presence of small amounts of myeloma cells in the body after treatment

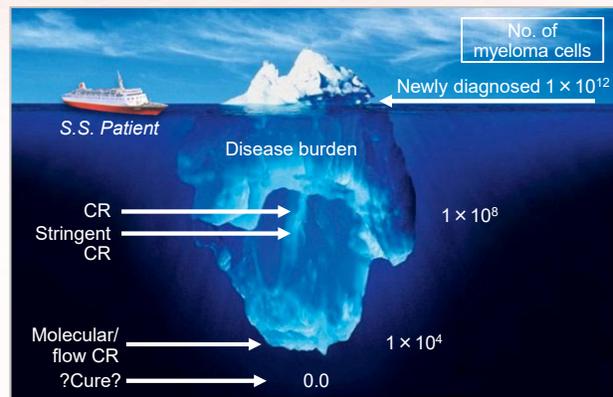

MRD tests can detect at least 1 cell in 100,000

77

## Why do we need to MRD?

- With new and more effective treatments, more patients achieve CR
- However, achieving a CR does not necessarily mean that all myeloma cells are gone
- Routine blood tests are not sensitive enough to detect these remaining cells

78

# How is MRD measured?

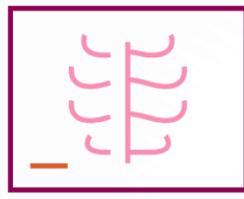

# Comprehensive Response Assessment

Right now, measurement of MRD depends on counting cells in bone marrow samples

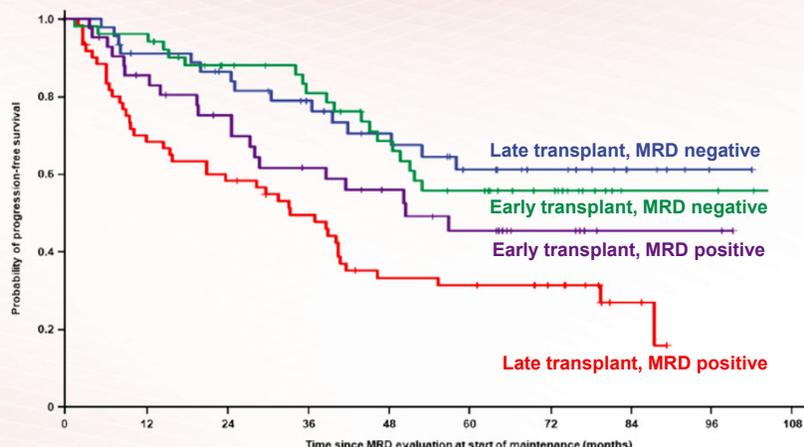

What about other areas of the body?

Imaging (with PET/CT scan) is also required to detect residual disease outside of the bone marrow

## Why is it important to achieve MRD negativity?

Patients who achieve MRD negativity following treatment experience longer remission than those who are still MRD positive after treatment.

MRD by next-generation sequencing (sensitivity  $1 \times 10^{-5}$ )  
Determination Study. Richardson PG et al. *N Engl J Med*. 2022;387:132.

81

## Patients Who Achieve MRD Negativity Following Treatment Live Longer Than Those Who Are MRD Positive

### Key points from 14 studies analyzed\*

Being MRD negative is correlated with longer progression-free and overall survival.

MRD negativity may not (?) carry the same weight in patients with standard-risk vs high-risk disease.

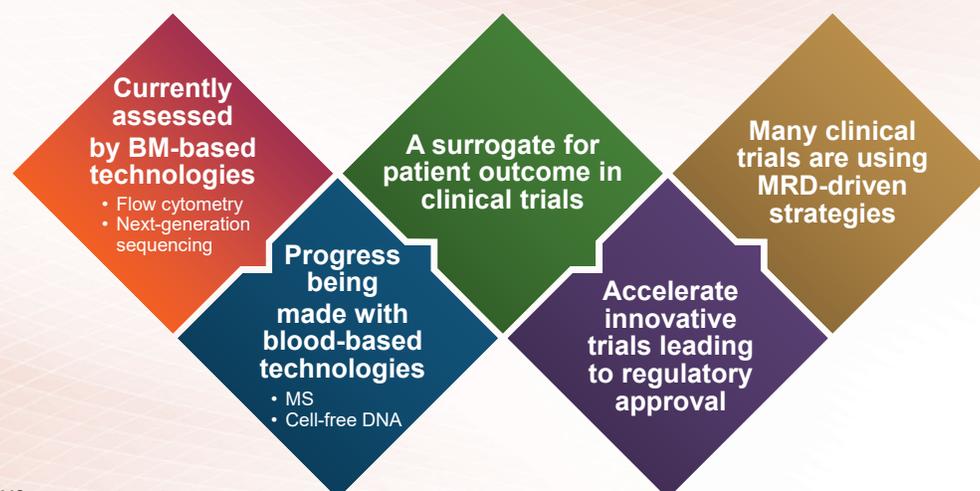

\*5 trials included stem cell transplantation/10 studies included maintenance

Munshi NC et al. *JAMA Oncol*. 2017;3:28.

82

## MRD Is Important for Clinical Care and New Drug Registration

BM, bone marrow; MS, mass spectrometry  
Anderson KC et al. *Clin Cancer Res.* 2021;27:5195.  
Costa LJ et al. *Leukemia.* 2021;35:18.

83

## Summary

### Autologous Stem Cell Transplantation

- ASCT remains the standard of care for frontline therapy of myeloma; its safety has been established and it induces long remissions.

### Continuous or Maintenance Therapy

- The body of evidence from phase 3 trials indicates that maintenance (or “continuous”) therapy improves PFS and likely OS and should be given until progression.
- Most patients should receive maintenance who are thought to be Revlimid responsive and able to tolerate the side effects.
- For patients who are unable to tolerate Revlimid there are other agents such as Ninlaro, Kyprolis, and Darzalex that are effective, but they are not yet FDA-approved for use as maintenance. Several clinical trials are under way.

### Minimal Residual Disease

- MRD is the deepest response after myeloma treatment, including bone marrow MRD and imaging MRD. NGF and NGS are the two most commonly used marrow MRD tests. Blood-based MRD is in exploration.
- MRD has been associated with longer progression-free and overall survival to predict lower risk of progression. Modern combination therapies show increasingly higher MRD negativity rate.
- MRD response-directed therapy has been applied in more and more clinical trials to explore how to guide treatment decisions in myeloma.
- MRD is also useful as an end point in clinical trials helping to expedite new drug approval in myeloma.

84

**Please take a moment to  
answer two questions  
about this presentation.**

85

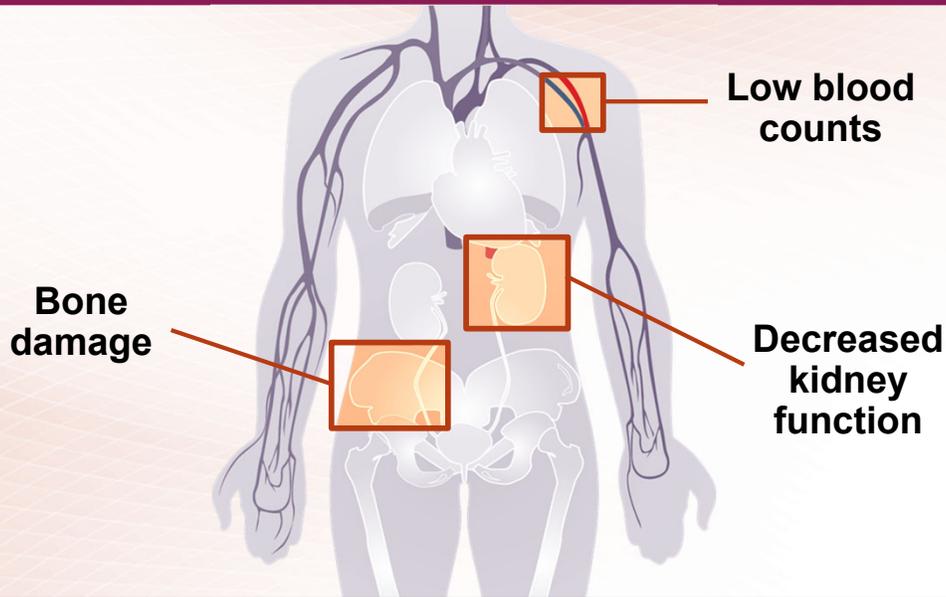

## **Supportive Care**

---

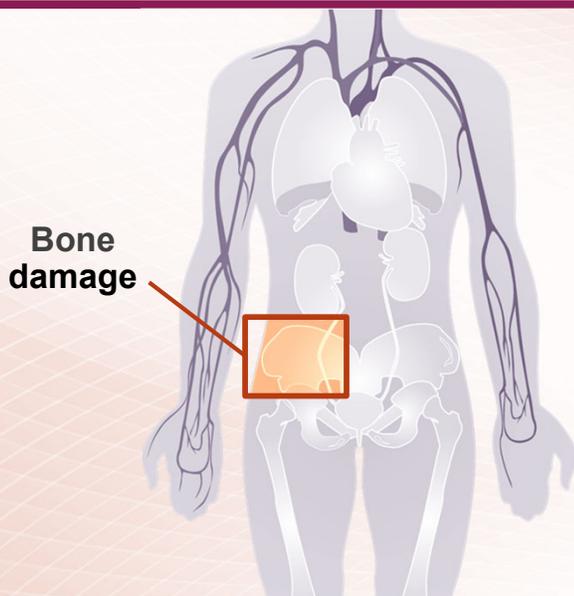

86

## Effects of Myeloma

87

## Effects of Myeloma: Bone Disease

- Occurs in 85% of patients
- Weakened bone due to lesions or “holes”
- Increased levels of calcium in the blood (hypercalcemia)
- Leads to
  - Pathologic fractures
  - Spinal cord compression/collapse
  - Bone pain

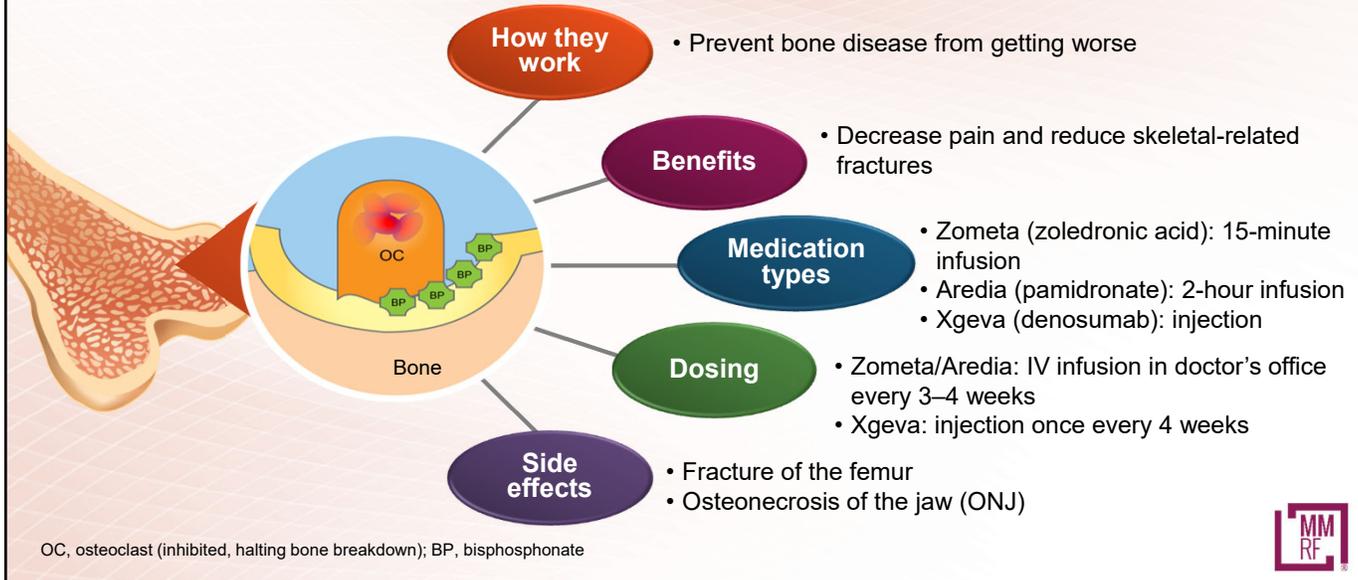

Fracture  
caused  
by lesion

Lesions

88

## Bone Strengthening Agents for Myeloma Bone Disease

89

## Recommendations for Reducing the Risk of ONJ

- Complete major dental work before beginning treatment for bone disease
- Practice good oral hygiene
- Schedule regular dental visits
- Let your dentist know that you are receiving treatment for bone disease
- Keep your doctor informed of dental issues/need for dental work
- Be attentive! ONJ seems to be related to the length of time patients are on treatment for bone disease

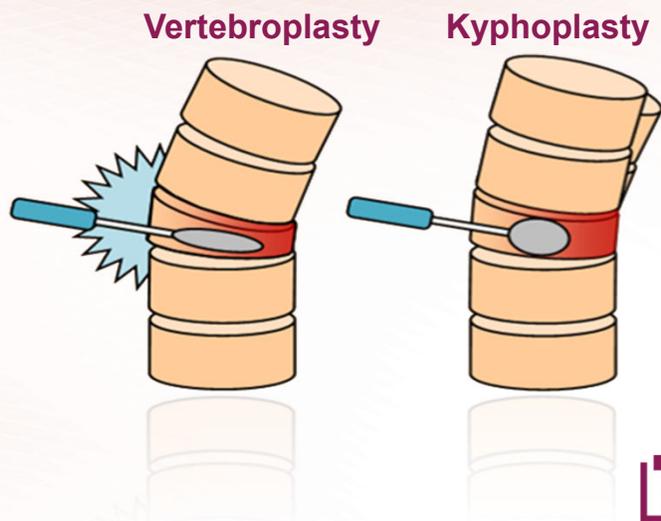

ONJ, osteonecrosis of the jaw

90

## Orthopedic Procedures to Stabilize the Spine

- Minimally invasive procedures
- Can be performed without hospitalization
- Small incision
- Cement filler stabilizes bone
- Potential for relatively rapid symptom relief (approximately 1 month with kyphoplasty)

91

## Radiation Therapy for Pain Management

92

# Pain Management Medications

## Acetaminophen (Tylenol)

Will not hurt your kidneys; high dosage can hurt your liver

## NSAIDs (nonsteroidal anti-inflammatory drugs)

Prefer to avoid with MM due to increased risk of kidney injury

## Opioids

Will not hurt kidneys, liver, stomach; potential for constipation, sedation, confusion, dependence, addiction

## Corticosteroids (dexamethasone, prednisone)

Will not hurt kidneys; can raise blood sugar; short- and long-term effects

## Gabapentin

93

# Effects of Myeloma: Low Blood Counts

- Symptoms
  - Fatigue; depression/mood changes; difficulty breathing; rapid heartbeat; dizziness
- Other causes
  - Low levels of iron, folate, and vitamin B12

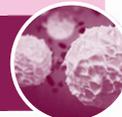

## Low red blood cells (anemia)

Treatment: Identify and treat causes other than myeloma; supplements; medications to increase number of red blood cells; blood transfusions

- Symptoms
  - Fatigue; frequent infections
- Other causes
  - Radiotherapy
  - Infection

## Low white blood cells (leukopenia)

Treatment: Medications to stimulate production of white blood cells; antibiotics; antifungal medications; infection prevention

- Symptoms
  - Easy or excessive bruising; superficial bleeding into the skin; prolonged bleeding from cuts; bleeding from the gums or nose; blood in urine or stool
- Other causes
  - Viral infection (hep B or C); immune thrombocytopenia; medications

## Low platelets (thrombocytopenia)

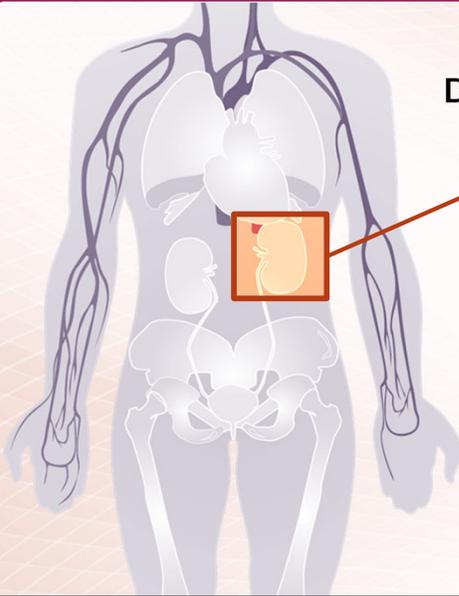

Treatment: Identify and treat causes other than myeloma; platelet transfusion; hold anticoagulation

94

## Effects of Myeloma: Decreased Kidney Function

**Decreased  
kidney  
function**

- Detection
  - Decreased amount of urine
  - Increase in creatinine and other proteins
- Other causes beside myeloma
  - Hypertension
  - Diabetes
  - Some medications
- Treatment
  - Fluids
  - Avoid nonsteroidal anti-inflammatory drugs such as Aleve, Advil/Motrin
  - Plasmapheresis
  - Treat other causes
  - Dialysis (severe)

95

## Main Body Systems Affected by Myeloma Treatment

- Myeloma patients are at increased risk of developing blood clots
- Several myeloma drugs are associated with an increased risk of deep vein thrombosis (DVT)

**Blood**

- Peripheral neuropathy is a condition that affects the nerves, resulting in pain, tingling, burning sensations, and numbness in the hands and feet
- Peripheral neuropathy may be caused by myeloma or its treatments

**Central  
Nervous  
System**

- Cardiovascular side effects (including high blood pressure or congestive heart failure) can occur with some myeloma drugs

**Cardio-  
vascular**

- Commonly used myeloma drugs may cause a variety of gastrointestinal problems, such as constipation, diarrhea, and nausea/vomiting

**Gastro-  
intestinal**

96

## Class: Immunomodulatory Drugs Side Effects and Management

### Revlimid\*

- Potential for blood clots
- Reduced blood counts
- Rash
- Fatigue
- Muscle pain or muscle cramping
- Diarrhea
- Small chance of second new cancers when given with melphalan

### Pomalyst\*

- Fatigue and weakness
- Reduced blood counts
- GI effects
- Shortness of breath
- Upper respiratory infection
- Back pain
- Fever
- Blood clots
- Mental fogginess

### Management

- Blood thinners
- Tonic water/increased fluid intake for cramps
- GI toxicity: avoid dairy; fibers (Metamucil); Imodium; colestipol; cholestyramine; dose reduction
- Sleep hygiene, regular exercise, dose reduction for fatigue

\*Black box warning.  
 GI, gastrointestinal

97

## Class: Proteasome Inhibitors Side Effects and Management

### Velcade

- PN (numbness, tingling, burning sensations and/or pain due to nerve damage)
- Low platelets
- GI problems: nausea, diarrhea, vomiting, loss of appetite
- Fatigue
- Rash

### Kyprolis

- Fatigue
- Anemia
- Nausea
- Low platelets
- Shortness of breath
- Diarrhea
- Fever
- Hypertension
- Cardiac toxicity

### Ninlaro

- Diarrhea
- Constipation
- Low platelets
- PN
- Nausea
- Peripheral edema
- Vomiting
- Back pain

### Management

- PN occurs less often when subcutaneous or once weekly dosing is used for Velcade
- Other PN prevention:
  - Vitamins and other supplements\*
  - Certain medications such as gabapentin, pregabalin, duloxetine, opioids
  - Acupuncture
  - Physical therapy
- Shingles-prevention pills
- Blood thinners

\*Do not take any supplements without consulting with your doctor.  
 PN, peripheral neuropathy; GI, gastrointestinal

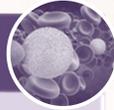

98

## Class: Monoclonal Antibodies Side Effects and Management

### Empliciti

- Low blood counts
- Infusion reactions

### Darzalex\*/Sarclisa

- Infusion reactions
- Fatigue
- Upper respiratory tract infection

\*Now approved as subcutaneous injection with fewer side effects.

### Management

- Premedication in anticipation of infusion reactions
- Post-infusion medications (Darzalex)

99

## XPOVIO: Selective Inhibitor of Nuclear Export Side Effects and Management

### Gastrointestinal

Consult with your doctor if nausea, vomiting, or diarrhea occur or persist. Begin prophylactic anti-nausea medications

### Low sodium (hyponatremia)

Maintain fluid intake

### Fatigue

Stay hydrated and active

### Low blood counts (cytopenias)

Report signs of bleeding right away  
 Report signs of fatigue or shortness of breath

Chari A et al. *Clin Lymphoma Myeloma Leuk.* 2021;21:e975.

100

# Bispecific Antibodies

## Tecvayli

- Cytokine release syndrome
- Injection-related reactions
- Injection-site reaction
- Infections
- Neutropenia
- Anemia
- Thrombocytopenia

## Management

- Available only through a Risk Evaluation and Mitigation Strategies (REMS) due to the risk of cytokine release syndrome
- Patients will receive step-up dosing and will be monitored in an inpatient setting
- Cytokine release syndrome is managed in the same fashion as CAR T
- Injection reactions are managed with oral antihistamines and topical steroids
- Infection prevention!
- COVID precautions

101

# CRS With Bispecifics Severity Is Typically Mild: Early Recognition and Treatment Is Key

## RESPIRATORY

- Difficulty breathing
- Shortness of breath

## HEPATIC

- Altered liver function tests in the blood

## RENAL

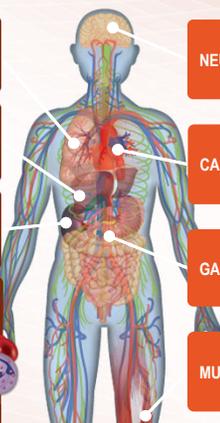

- ↑ Serum creatinine
- Renal insufficiency

## HEMATOLOGIC

- Anemia
- Thrombocytopenia
- Neutropenia

## CONSTITUTIONAL

- Fever
- Fatigue
- Headache

## NEUROLOGIC

- Tremors
- Altered wakefulness
- Difficulty speaking

## CARDIOVASCULAR

- Rapid heart rate
- Low blood pressure
- Arrhythmias

## GASTROINTESTINAL

- Nausea
- Vomiting
- Diarrhea

## MUSCULOSKELETAL

- Weakness

## Mitigation and monitoring for CRS

- Step-up dosing with hospitalization for monitoring
- Frequent vital signs
- Rule out infection
- Laboratory monitoring
- Early intervention with tocilizumab

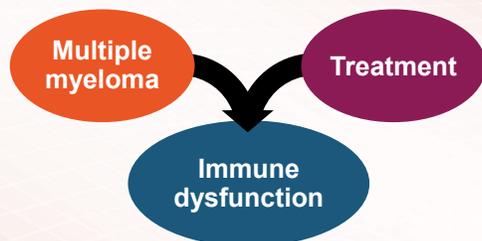

ALP, alkaline phosphatase; CPK, creatine phosphokinase; CRP, C-reactive protein; CRS, cytokine release syndrome; LDH, lactate dehydrogenase; O<sub>2</sub>, oxygen; TLS, tumor lysis syndrome.

102

## Infection Can be Serious for Patients With Myeloma

**7–10-fold increased risk of bacterial and viral infections for people with myeloma**

Report fever of more than 100.4°F, shaking chills even without fever, dizziness, shortness of breath, low blood pressure to HCP as directed.

### General infection-prevention tips

- Good personal hygiene (skin, oral)
- Environmental control (wash hands, avoid crowds and sick people, etc)
- Growth factor (Neupogen [filgrastim])
- Immunizations (NO live vaccines)
- Medications (antibacterial, antiviral)

As recommended by your health care team

Brigle K et al. *Clin J Oncol Nurs.* 2017;21(5)suppl:60. Faiman B et al; IMF Nurse Leadership Board. *Clin J Oncol Nurs.* 2011;15(Suppl):66. Miceli TS et al. *Clin J Oncol Nursing.* 2011;15(4):9. ASH Website. COVID-19 Resources. [www.hematology.org/covid-19/covid-19-and-multiple-myeloma](http://www.hematology.org/covid-19/covid-19-and-multiple-myeloma)

103

## BCMA-Targeted Therapies Are Associated With an Increased Risk of Infections

- Both viral and bacterial
  - Up to 1/3 of patients in clinical trials have serious infections (requiring IV antibodies or hospitalization)
- Increased risk of serious COVID complications despite history of vaccination
  - Antibody levels
  - Immediate treatment once diagnosed nirmatrelvir with ritonavir (Paxlovid)
    - Start as soon as possible; must begin within 5 days of when symptoms start
  - Oral prophylactic antimicrobials

104

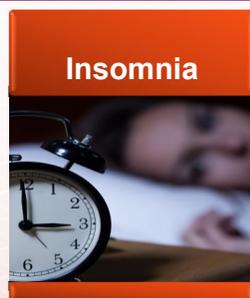

## Infection Prevention

- Avoid crowds
- Ensure handwashing, hygiene
- Growth factor (for example, filgrastim)
- IVIG for hypogammaglobulinemia
  - Know your healthy IgG level
- Immunizations (No live vaccines)
  - COVID-19 vaccination + booster(s)
  - Pneumococcal 20-valent conjugate vaccine
  - Seasonal inactivated influenza vaccine (×2 or high-dose)
  - Shingles vaccine: zoster vaccine recombinant, adjuvanted
- COVID-19 prevention
  - Antibody levels
  - Tixagevimab co-packaged with cilgavimab

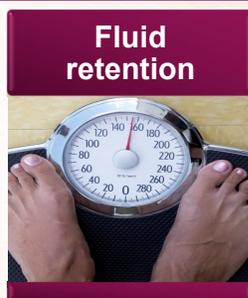

105

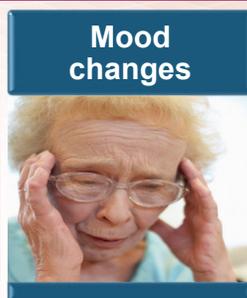

## Side Effects of Steroids (Dexamethasone)

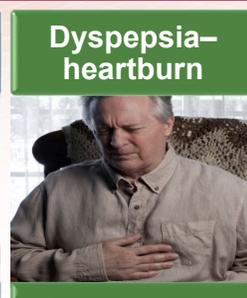

- Healthy sleep habits
- Timing
- Medication to assist with sleeping as needed

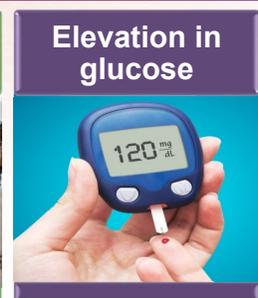

- Monitor for swelling of extremities and "puffy" face
- Monitor weight changes/gain
- Reduce dose

- Irritable, anxiety, difficulty concentrating
- Severe cases → depression, euphoria

- Dietary modifications (spicy, acidic foods)
- Avoid NSAIDs
- Acid-blocking medications
- Take steroid with food; use enteric-coated aspirin with food

- Monitor glucose and refer/treat as needed

106

## Symptom Management Constipation

- Stimulant laxatives
  - Mild: senna/sennoside (Senokot)
    - 1–2 pills twice a day
  - More potent: bisacodyl (Dulcolax)
- Osmotic laxatives
  - Gentle, pulls water into the intestine
    - Lactulose
    - Miralax
- Bulking agents
  - Soluble fiber: psyllium (Metamucil)

107

## Symptom Management Acid Reflux/Heartburn

- Our stomachs make a powerful acid to digest food, hydrochloric acid
- Hydrochloric acid can also digest our stomach lining → leads to gastritis and ulcers

### **A few ways to treat**

1. Decrease the amount of acid the stomach is making
  - a. Zantac, Pepcid
  - b. Prilosec, Prevacid, Protonix, Nexium
2. Absorb excess acid: Tums, Maalox, Mylanta
3. Coat stomach: Carafate
4. Avoid late night eating

108

## Symptom Management Insomnia

- Causes: anxiety, stress, meds—dexamethasone
- Sleep hygiene
  - Routine: go to bed, wake up at routine times
  - Exercise
  - No TV or screens when trying to sleep
  - Relaxation training; meditation/yoga/Reiki
  - Counseling support
- Medications: useful but all have drawbacks
  - Lorazepam (Ativan)
  - Zolpidem (Ambien)
  - Diphenhydramine (Benadryl)

109

## Marijuana

- Claims and hype: advocates and detractors
  - Promoted as relieving pain and muscle spasm, improving appetite, decreasing nausea, helping anxiety and insomnia, *and even curing cancer*
- Laws vary by state
- Marijuana contains 100 **cannabinoids**, most notably **THC** and **CBD**
- Sativex contains equal parts THC and CBD
  - Available in Great Britain and Canada
  - Double-blind trial in 2015: effective but no more effective than placebo for cancer pain; not available in U.S.
- Bottom line: marijuana has been shown to have modest benefits in symptom management; claims of dramatic results are anecdotal and have not been proven

110

## Daily Living

Proper  
nutrition

Exercise

Rest

Social  
contacts

111

## Taking Care of Yourself

Talk to your provider about side effects... there is usually a way to make treatment tolerable.

Pay attention to your own needs and don't be afraid to ask for help.

Learn more about multiple myeloma.

Look for the positive.

112

**Please take a moment to  
answer two questions  
about this presentation.**

113

## **Personalized Medicine**

**Jonathan Keats, PhD**  
Translational Genomics Research Institute  
Phoenix, Arizona

114

## Multiple Myeloma Is Not Just One Disease!

Multiple myeloma is a heterogeneous disease even within cytogenetically defined molecular subtypes.

In the future, the goal is to go beyond a one-size-fits-all approach.

*How do we customize treatment?*  
**Personalized medicine**

115

## Treatment of Multiple Myeloma

### Where are we now?

- Standard induction with proteasome inhibitors and IMiDs, consolidation with ASCT, and maintenance therapy have benefited the majority of multiple myeloma patients
- A subset of myeloma patients still have poor outcome with standard therapy
- Personalized medicine approaches needed to address high-risk patients

### What We Need

- Evolving definitions of high-risk, beyond historic markers such as translocation 4;14, deletion of chromosome 17p
- Advanced molecular diagnostics are key to revealing individual targets and therapies
- Immunotherapies are emerging as promising new weapons in the fight against multiple myeloma

IMiDs, immunomodulatory drugs; ASCT, autologous stem cell transplantation

116

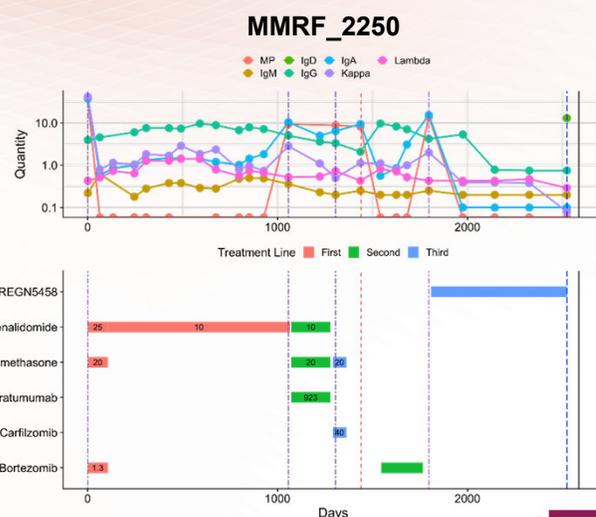

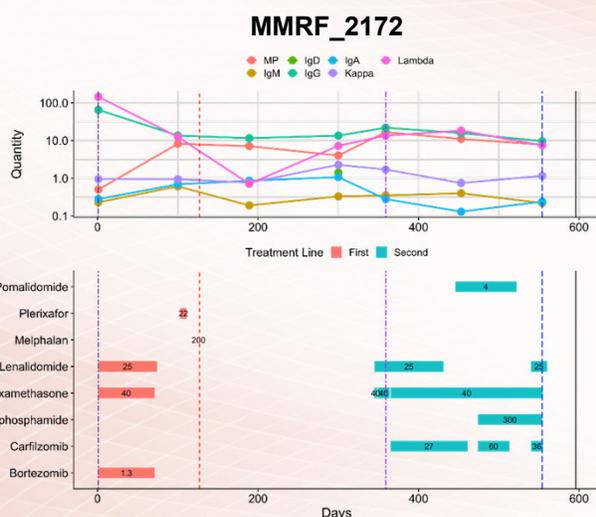

# An Example of the Importance of Personalized Medicine

120

# Actionable Alterations in MM

These alterations may be the Achilles' heel of myeloma cells.

Precision medicine efforts have identified molecular alterations for which there are drugs in the clinic

121

# Personalized Medicine Agents Under Clinical Investigation

| Clinical phase | Novel agents   |
|----------------|--|
|                | Personalized medicine  |
| Phase 3        | Venetoclax*  |
| Phase 1, 2     | Abemaciclib*<br>Cobimetinib*<br>Dabrafenib<br>Enasidenib<br>Erdafitinib*<br>Idasanutlin<br>Trametinib<br>Vemurafenib |

\*Being studied in the MyDRUG trial

122

## BRAF and MEK

PET CT before and after 2 months of vemurafenib (a BRAF inhibitor) treatment in patient with *BRAF V600E* mutation

Sharman JP et al. *Clin Lymphoma Myeloma Leuk*. 2014;14:e161.

A phase 2 study evaluating combined BRAF and MEK inhibition in relapsed/refractory multiple myeloma patients with activating *BRAF V600E* mutations

- 12 patients treated with
  - BRAFTOVI (encorafenib)
  - MEKTOVI (binimetinib)
- 83% of patients responded to treatment
- Common side effects included blurred vision, macular edema, cramps, arthralgia, diarrhea, rash, and decreased left ventricular function
- Serious side effects included low blood counts and hypertension

GMMG-Birma Trial. Raab MS et al. *Blood*. 2020;136. Abstract 294.

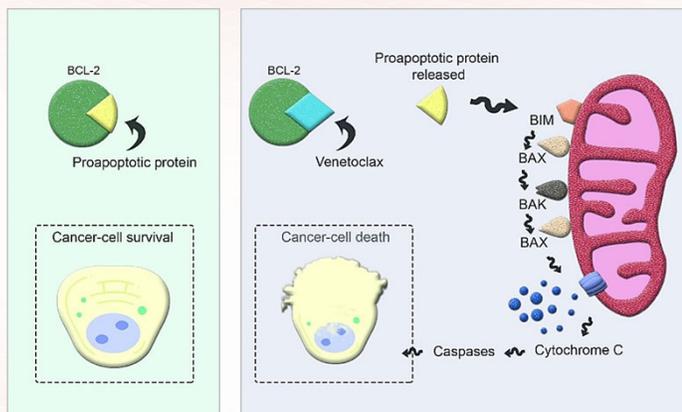

123

## Venetoclax and t(11;14)

Venetoclax is a Bcl-2 inhibitor

- BCL2 inhibitor
- Induces cancer cell death
- t(11;14) multiple myeloma → ↑BCL2 and ↓MCL1
- t(11;14): first predictive marker in multiple myeloma, indicating susceptibility to BCL2 inhibition

Ehsan H et al. *J Hematol*. 2021;10:89.

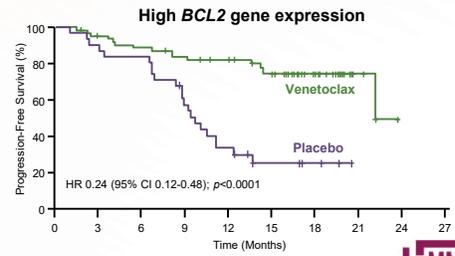

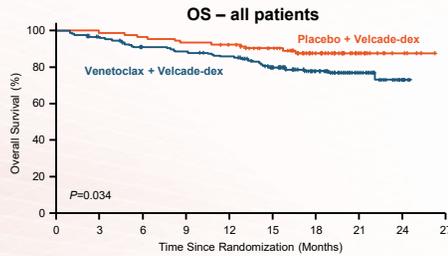

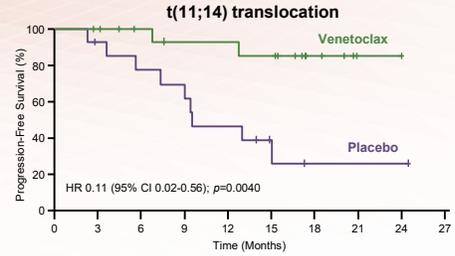

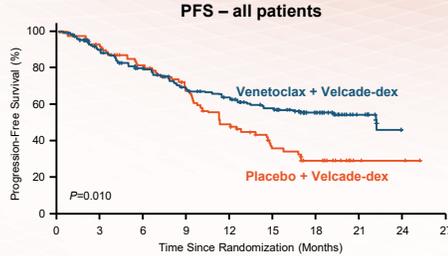

124

# Venetoclax and t(11;14)

Venetoclax bortezomib dex vs placebo bortezomib dex;  
 1-3 prior lines

Median follow up 18.7 m mPFS  
 22.4 m venetoclax  
 11.5 m placebo

**Venetoclax especially active in t(11;14) or BCL2<sup>high</sup> MM**

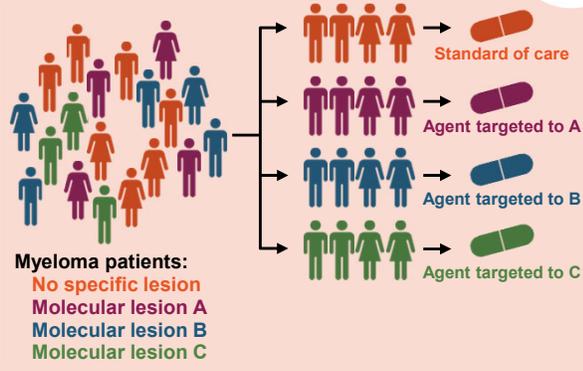

The BELLINI Trial. Kumar SK et al. *Lancet Oncol.* 2020;21:1630.

125

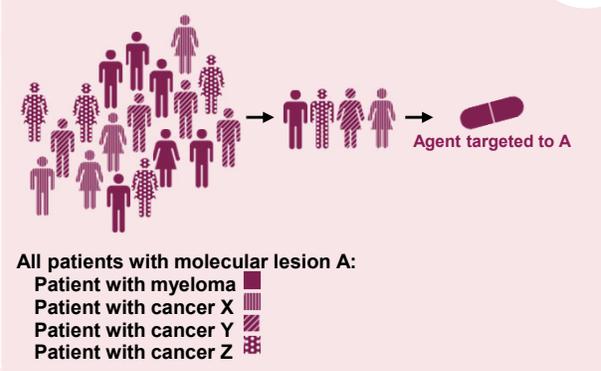

# Innovative Trial Designs: Shaping the Future of Cancer Research Toward Precision Medicine

## Umbrella/platform trials

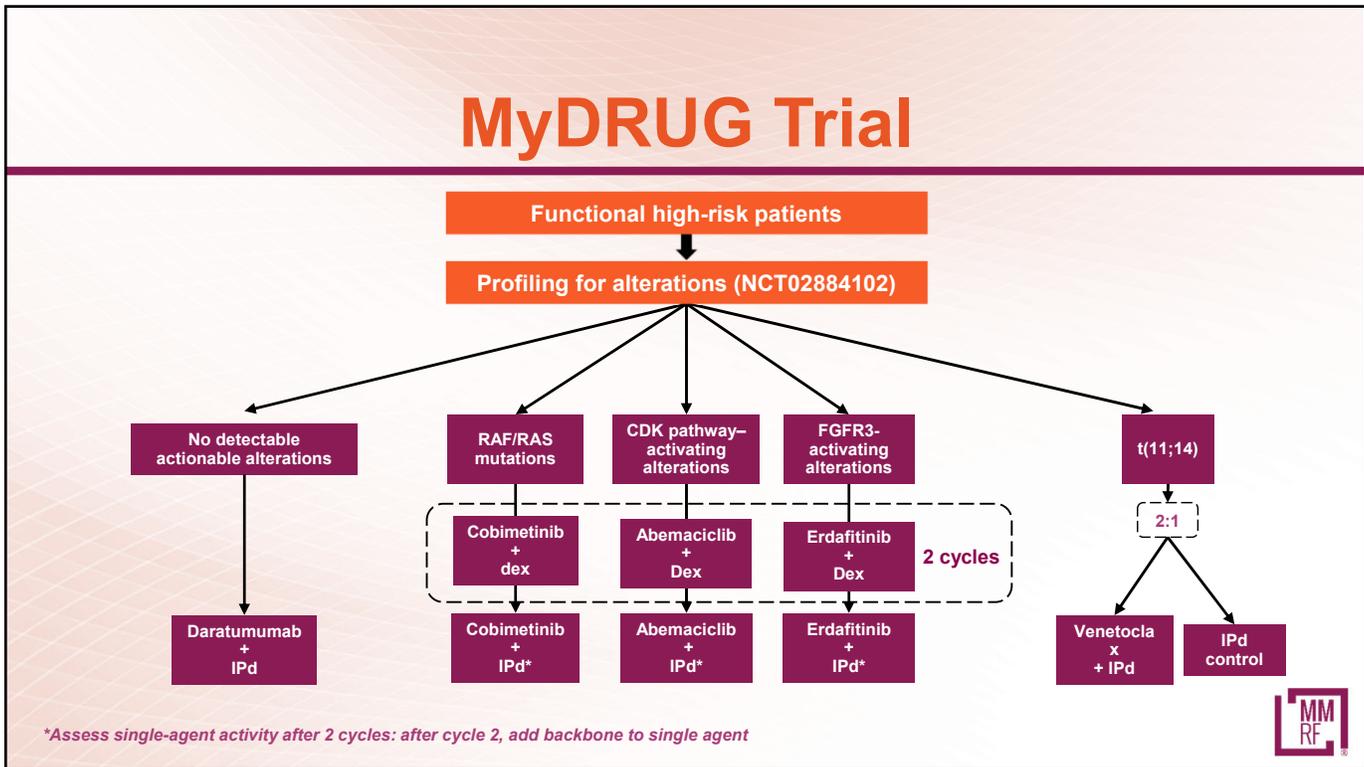

Pawlyn C, Davies F. *Blood.* 2019;133:660.

## Basket/bucket trials

126

127

## Precision Medicine in Myeloma: MyDRUG (NCT03732703)

### Case study: Man, age 59

#### Treatments

**1st Line**

- VRd/KRd induction, ASCT, Rev maintenance
- Best response: CR
- Progressed in 30 months (22 months post-ASCT/maint.)

**2nd Line**

- EPd
- Best response: MR
- Progressed in 4 months

**3rd Line**

- MyDRUG

### Response on MyDRUG

| Time (months) | M-Spike (g/dL) | kappa sFLC (mg/L) |
|---------------|----------------|-------------------|
| 1             | 1.7            | 25                |
| 2             | 1.8            | 18                |
| 3             | 1.4            | 8                 |
| 4             | 1.2            | 7                 |
| 5             | 0.8            | 3                 |
| 6             | 0.4            | 3                 |
| 7             | 0.3            | 2                 |
| 8             | 0.4            | 2                 |
| 9             | 0.3            | 2                 |
| 10            | 0.2            | 2                 |
| 11            | 0.2            | 2                 |
| 12            | 0.2            | 2                 |
| 13            | 0.2            | 2                 |

#### Genomics

- Hyperdiploid, del13q, del1p, Myc ampl.
- NRAS Q61H, 56% allelic fraction

128

## The Road Ahead

- Comprehensive translational and clinical research to find the best combinations of targeted and immune therapies for each group of myeloma patient
- Deliver on the promise of personalized medicine for every patient

129

## Precision Medicine Summary

- Efforts are under way to better understand the nature of the disease and to provide patients with a more personalized approach to treatment.
- Genomic sequencing and data from myeloma patients are key to identifying subtype: our goal is to help individualize treatment for better outcomes.
- Participation in clinical trials to provide bone marrow and peripheral blood is paramount.
- Personalized medicine provides the right treatment at the right time for each myeloma patient.

130

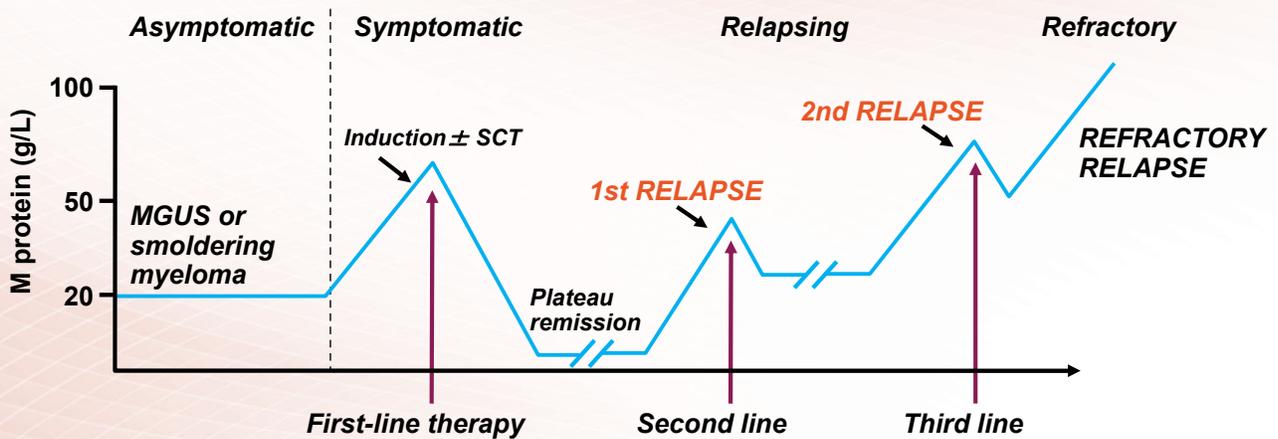

# Relapsed/Refractory Multiple Myeloma

**Sumit Madan, MD**  
Banner MD Anderson Cancer Center  
Gilbert, Arizona

131

## Multiple Myeloma Is a Marathon, Not a Sprint

Adapted from Borrello I. *Leuk Res.* 2012;36 Suppl 1:S3.

132

## Definitions: What is relapsed/refractory disease and a line of therapy?

- **Relapsed:** recurrence (reappearance of disease) after a response to therapy
- **Refractory:** progression despite ongoing therapy
- **Progression:** change in M protein/light chain values
- **Line of therapy:** change in treatment due to either progression of disease or unmanageable side effects
  - **Note:** initial (or induction) therapy + stem cell transplant + consolidation/maintenance therapy = 1 line of therapy

133

## Biochemical Relapse or Clinical Relapse

### Biochemical

- Patients with asymptomatic rise in blood or urine M protein, free light chains, or plasma cells

Timing of therapy initiation/escalation dependent on many factors

### Clinical

- Based on direct indicators of increasing disease and/or end-organ dysfunction

Requires immediate initiation/escalation of therapy

134

## Choosing Therapy for First or Second Relapse

### Choices are broadest and guided by

Disease biology

Nature of relapse

Patient preference

### Factors to consider

Prior autologous stem cell transplant

Prior therapies

Aggressiveness of relapse

Comorbidities

Psychosocial issues

Access to care

135

## Options for Relapsed/Refractory Disease Continue to Increase

| IMiDs                   | Proteasome inhibitors  | Chemotherapy anthracyclines   | Chemotherapy alkylators    | Steroids      | Other mechanisms of action | Monoclonal antibodies           | Cellular therapy                     |
|-------------------------|------------------------|-------------------------------|----------------------------|---------------|----------------------------|---------------------------------|--------------------------------------|
| Thalomid (thalidomide)  | Velcade (bortezomib)   | Adriamycin                    | Cytoxan (cyclophosphamide) | Dexamethasone | XPOVIO (selinexor)         | Empliciti (elotuzumab)          | Abecma (idecabtagene vicleucel)      |
| Revlimid (lenalidomide) | Kyprolis (carfilzomib) | Doxil (liposomal doxorubicin) | Bendamustine               | Prednisone    | Venclexta (venetoclax)*    | Darzalex (daratumumab)          | Carvykti (ciltacabtagene autoleucel) |
| Pomalyst (pomalidomide) | Ninlaro (ixazomib)     |                               | Melphalan                  |               | Farydak (Panobinostat)†    | Sarclisa (isatuximab)           |                                      |
|                         |                        |                               |                            |               | Pepaxto (melflufen)†       | Blenrep (belantamab mafodotin)‡ |                                      |
|                         |                        |                               |                            |               |                            | Tecvayli (teclistamab)§         |                                      |

\*Not yet FDA-approved for patients with multiple myeloma; †Withdrawn from the US market in 2021; ‡Antibody-drug conjugate, withdrawn from the US market in 2022; §Bispecific antibody

**New formulations, new dosing, and new combinations, too!**

136

# Three Drugs Withdrawn From US Market *What happened?*

All drugs were granted accelerated approval by the FDA which requires further clinical studies to verify a drug's clinical benefit.

### Withdrawn 2021

#### Farydak (panobinostat)

- The required clinical studies were not completed within the FDA-specified time frame

#### Pepaxto (melflufen)

- The phase 3 OCEAN study compared Pepaxto-dex with Pomalyst-dex in patients with relapsed/refractory myeloma
  - Overall survival with Pepaxto-dex was not improved versus Pomalyst-dex which didn't pass the regulatory hurdles to confirm the accelerated approval in the U.S.

### Withdrawn 2022\*

#### Blenrep (belantamab mafodotin)

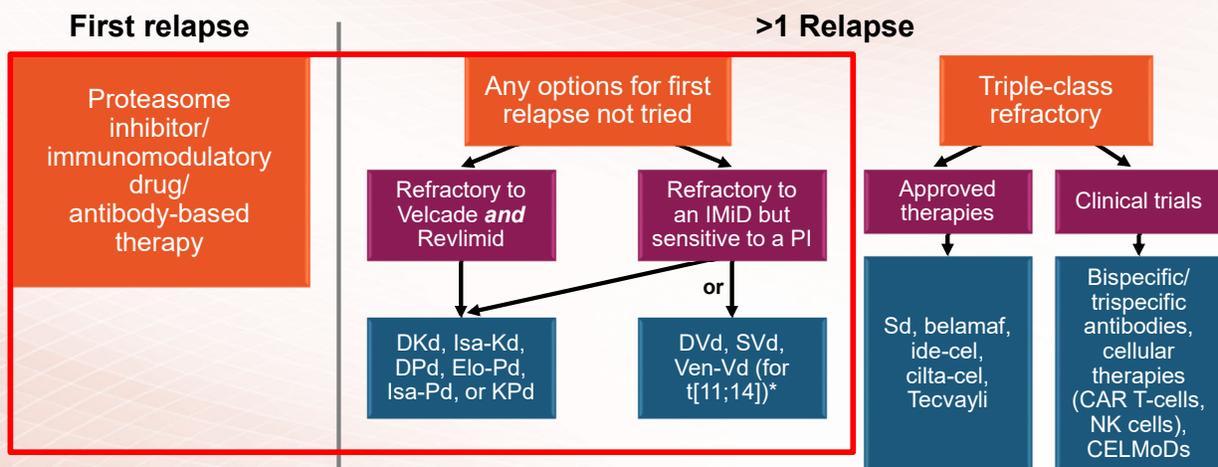

- Results from the confirmatory phase 3 DREAMM-3 study that compared Blenrep with Pomalyst-dex in patients with relapsed/refractory myeloma after at least two prior lines of therapy showed that progression-free survival with Blenrep was not improved versus Pomalyst-dex
- The DREAMM clinical study program is continuing as a path forward for approval with two ongoing phase 3 studies (DREAMM-7 and DREAMM-8) testing Blenrep in combinations in an earlier treatment setting for patients who have tried at least one prior line of therapy
  - Results are anticipated in the first half of 2023

\*Marketing of Blenrep continues in other countries where it has been approved.

137

# Treatment Approach

D, daratumumab (Darzalex); K, carfilzomib (Kyprolis); d, dexamethasone; Isa, isatuximab (Sarclisa); P, pomalidomide (Pomalyst); Elo, elotuzumab (Empliciti); V, bortezomib (Velcade); S, selinexor (Xpovio); Ven, venetoclax (Venclexta); belamaf, belantamab mafodotin (Blenrep); ide-cel, idecabtagene vicleucef (Abecma); cilta-cel, ciltacabtagene autoleucef (Carvykti);

\*Not yet approved for use in myeloma patients.

138

## Triplet Regimens for Early Relapse

139

## Currently Available Naked Monoclonal Antibodies for One to Three Prior Lines of Therapy

| Drug                   |   | Formulation  | Approval  |
|------------------------|---|--|---|
| Darzalex (daratumumab) |  | SC once a week for first 8 weeks, then every 2 weeks for 4 months, then monthly  | <ul style="list-style-type: none"> <li>For <b>relapsed/refractory</b> myeloma as a single agent and as a triplet with Revlimid or Velcade or Kyprolis or Pomalyst plus dexamethasone</li> </ul> |
| Empliciti (elotuzumab) |  | IV once a week for first 8 weeks, then every 2 weeks (or every 4 weeks with pom) | <ul style="list-style-type: none"> <li>For <b>relapsed/refractory</b> myeloma as a triplet with Revlimid or Pomalyst and dexamethasone</li> </ul>   |
| Sarclisa (isatuximab)  |  | IV once a week for first 4 weeks, then every 2 weeks                             | <ul style="list-style-type: none"> <li>For <b>relapsed/refractory</b> myeloma as a triplet with Pomalyst or Kyprolis and dexamethasone</li> </ul>   |

IV, intravenous; SC, subcutaneous

140

## Currently Available Agents for One to Three Prior Lines of Therapy

| Drug                     | Formulation  | Approval   |
|--------------------------|--|--|
| Velcade (bortezomib)     |  <ul style="list-style-type: none"> <li>• IV infusion</li> <li>• SC injection</li> </ul>  | • For <b>relapsed/refractory</b> myeloma   |
| Kyprolis (carfilzomib)   |  <ul style="list-style-type: none"> <li>• IV infusion</li> <li>• Weekly dosing</li> </ul> | • For <b>relapsed/refractory</b> myeloma as a single agent, as a doublet with dexamethasone, and as a triplet with Revlimid or Darzalex plus dexamethasone |
| Ninlaro (ixazomib)       |  <ul style="list-style-type: none"> <li>• Once-weekly pill</li> </ul>                     | • For <b>relapsed/refractory</b> myeloma as a triplet with Revlimid and dexamethasone  |
| Revlimid (lenalidomide)* |  <ul style="list-style-type: none"> <li>• Once-daily pill</li> </ul>                      | • For <b>relapsed/refractory</b> myeloma in combination with dexamethasone   |
| Pomalyst (pomalidomide)* |  <ul style="list-style-type: none"> <li>• Once-daily pill</li> </ul>                      | • For <b>relapsed/refractory</b> myeloma in combination with dexamethasone   |
| XPOVIO (selinexor)       |  <ul style="list-style-type: none"> <li>• Once-weekly pill</li> </ul>                     | • For <b>relapsed/refractory</b> myeloma as a triplet with Velcade and dexamethasone   |

\*Black box warnings: embryo-fetal toxicity; hematologic toxicity (Revlimid); venous and arterial thromboembolism

IV, intravenous; SC, subcutaneous

141

## Monoclonal Antibody–Based Regimens for Early Relapse: Darzalex

|   | POLLUX   | CASTOR   | CANDOR  | APOLLO   |
|---|--|--|---|--|
| <b>Regimens compared</b>                        | • Darzalex-Revlimid-dex (DRd) vs Rd  | • Darzalex-Velcade-dex (DVd) vs Vd   | • Darzalex-Kyprolis-dex (DKd) vs Kd   | • Darzalex-Pomalyst-dex (DPd) vs Pd  |
| <b>Median progression-free survival favored</b> | • DRd: 45 vs 18 months   | • DVd: 17 vs 7 months  | • DKd: 29 vs 15 months  | • DPd: 12 vs 7 months  |
| <b>Clinical considerations</b>                  | <ul style="list-style-type: none"> <li>• Consider for relapses from Revlimid or Velcade maintenance</li> <li>• DRd associated with more upper respiratory infections, low blood white blood cell counts, and diarrhea</li> </ul> | <ul style="list-style-type: none"> <li>• Consider for patients who are Revlimid-refractory without significant neuropathy</li> <li>• DVd associated with more low blood cell counts</li> </ul> | <ul style="list-style-type: none"> <li>• Consider for younger, fit patients who are double-refractory to Revlimid and Velcade</li> <li>• DKd associated with more respiratory infections</li> <li>• Severe side effects (possibly fatal) in intermediate fit patients 65 and older</li> </ul> | <ul style="list-style-type: none"> <li>• Consider in patients who are double-refractory to Revlimid and a proteasome inhibitor (Velcade, Kyprolis, Ninlaro)</li> <li>• Severe low white blood cell counts</li> </ul> |

142

## Monoclonal Antibody–Based Regimens for Early Relapse: Sarclisa and Efficiti

|   | ELOQUENT-2   | ELOQUENT-3   | ICARIA-MM  | IKEMA  |
|---|--|--|--|--|
| <b>Regimens compared</b>                        | • Efficiti-Revlimid-dex vs Rd  | • Efficiti-Pomalyst-dex vs Pd  | • Sarclisa-Pomalyst-dex vs Pd  | • Sarclisa-Kyprolis-dex vs Kd  |
| <b>Median progression-free survival favored</b> | • Efficiti-Rd: 19 vs 15 months   | • Efficiti-Pd: 10 vs 5 mos   | • Sarclisa-Pd: 12 vs 7 mos   | • Sarclisa-Kd: 42 vs 21 mos  |
| <b>Clinical considerations</b>                  | <ul style="list-style-type: none"> <li>Consider for non-Revlimid refractory, frailer patients</li> <li>Overall survival benefit with Efficiti-Rd</li> <li>Efficiti-Rd associated with more infections</li> </ul> | <ul style="list-style-type: none"> <li>Consider for patients refractory to Revlimid and a proteasome inhibitor (Velcade, Kyprolis, Ninlaro)</li> </ul> | <ul style="list-style-type: none"> <li>Consider for patients refractory to Revlimid and a proteasome inhibitor (Velcade, Kyprolis, Ninlaro)</li> <li>Sarclisa-Pd associated with severe low white blood cell counts, more dose reductions, upper respiratory infections, and diarrhea</li> </ul> | <ul style="list-style-type: none"> <li>Consider for patients refractory to Revlimid and Velcade</li> <li>Sarclisa-Kd associated with higher MRD negativity rates</li> <li>Sarclisa-Kd associated with severe respiratory infections</li> </ul> |

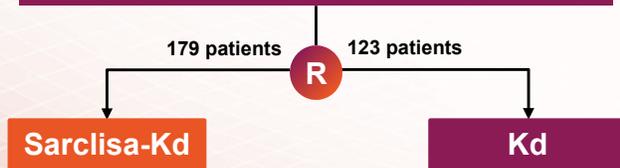

143

## Update From the 2022 American Society of Hematology (ASH) Meeting Sarclisa After Early or Late Relapse

### IKEMA Study

Patients with relapsed/refractory myeloma who received 1–3 prior therapies, no prior therapy with Kyprolis and not refractory to prior anti-CD38 antibody

Data evaluated according to patients who experienced an early\* versus late† relapse.

|   | Early Relapse |      | Late Relapse |      |
|---|---------------|------|--------------|------|
|   | Sarclisa-Kd   | Kd   | Sarclisa-Kd  | Kd   |
| Median progression-free survival (months) | 24.7          | 17.2 | 42.7         | 21.9 |
| Overall response rate (%)                 | 82            | 82.6 | 90.4         | 86.1 |
| ≥VGPR rate (%)                            | 67.2          | 52.2 | 76           | 58.3 |
| MRD negativity rate (%)                   | 24.6          | 15.2 | 37.5         | 16.7 |
| MRD-negative CR rate (%)                  | 18            | 10.9 | 30.8         | 13.9 |

Regardless of early or late relapse, RRMM patients benefit from the use of isa-Kd with respect to depth of response and prolonged PFS.

\*<12 months from initiation of most recent line of therapy (for patients who had ≥2 lines of therapy); <12 months (for patients who had 1 prior line of therapy) and <12 months from ASCT

†≥12 months from initiation of most recent line of therapy (for patients who had ≥2 lines of therapy); ≥18 months for patients who had 1 prior line of therapy)

Facon T et al. *Blood*. 2022;140. Abstract 753.

## Proteasome Inhibitor– and Immunomodulatory Drug–Based Regimens for Early Relapse

|   | OPTIMISMM   | ASPIRE  | TOURMALINE-MM1  | BOSTON   |
|---|---|---|---|--|
| <b>Regimens compared</b>                        | • Velcade-Pomalyst-dex (VPd) vs Vd  | • Kyprolis-Revlimid-dex (KRd) vs Rd   | • Ninlaro-Rd (IRd) vs Rd  | • XPOVIO-Velcade-dex (XPO-Vd) vs Vd  |
| <b>Median progression-free survival favored</b> | • VPd: 11 vs 7 months   | • KRd: 26 vs 17 months  | • IRd: 21 vs 15 months  | • XPO-Vd: 14 vs 9 months   |
| <b>Clinical considerations</b>                  | <ul style="list-style-type: none"> <li>• Consider for relapse on Revlimid</li> <li>• VPd associated with more low blood counts, infections, and neuropathy than Pd</li> </ul> | <ul style="list-style-type: none"> <li>• KRd associated with more upper respiratory infections and high blood pressure than Rd</li> </ul> | <ul style="list-style-type: none"> <li>• IRd an oral regimen</li> <li>• Gastrointestinal toxicities and rashes</li> <li>• Lower incidence of peripheral neuropathy</li> </ul> | <ul style="list-style-type: none"> <li>• XPO-Vd associated with low platelet counts and fatigue with triplet, but less neuropathy than the Vd</li> </ul> |

145

## Important Considerations for Use of Monoclonal Antibodies

|  |   |  |
|--|---|--|
| <p><b>Darzalex</b></p> <ul style="list-style-type: none"> <li>• <b>Infusion reactions</b> <ul style="list-style-type: none"> <li>– Less with SC use</li> </ul> </li> <li>• <b>Risk of shingles</b> <ul style="list-style-type: none"> <li>– Use appropriate vaccination</li> </ul> </li> <li>• Increased risk of <b>hypogammaglobulinemia</b> and upper respiratory infections                             <ul style="list-style-type: none"> <li>– Bactrim prophylaxis</li> <li>– IVIG support</li> </ul> </li> </ul> | <p><b>Empliciti</b></p> <ul style="list-style-type: none"> <li>• <b>Infusion reactions</b></li> <li>• <b>Risk of shingles</b> <ul style="list-style-type: none"> <li>– Use appropriate vaccination</li> </ul> </li> </ul> | <p><b>Sarclisa</b></p> <ul style="list-style-type: none"> <li>• <b>Infusion reactions</b></li> <li>• <b>Risk of shingles</b> <ul style="list-style-type: none"> <li>– Use appropriate vaccination</li> </ul> </li> </ul> |
|--|---|--|

SC, subcutaneous; IVIG, intravenous immunoglobulin

146

## Important Considerations for Use of Proteasome Inhibitors

### Velcade

- Risk of **peripheral neuropathy (PN)**; numbness, tingling, burning sensations and/or pain due to nerve damage
  - Avoid in patients with severe existing PN
  - Reduced with subcutaneous once-weekly dosing
- High risk of **shingles**
  - Use appropriate vaccination
- No dose adjustment for kidney issues; adjust for liver issues

### Kyprolis

- Less **PN** than Velcade
- High risk of **shingles**
  - Use appropriate vaccination
- Monitor for **heart, lung, and kidney side effects**
  - Use with caution in older patients with cardiovascular risk factors
- High blood pressure
- No dose adjustment for kidney issues; adjust for liver issues

### Ninlaro

- Less **PN** than Velcade
- High risk of **shingles**
  - Use appropriate vaccination
- Monitor for rashes and **gastrointestinal (GI)** side effects
  - GI effects occur early
- Needs to be taken at least 1 hour before or 2 hours after a meal

147

## Important Considerations for Use of Immunomodulatory Drugs

### Revlimid\*

- **Rash**
  - Consider antihistamines
- **Diarrhea**
  - Consider bile acid sequestrants
- Risk of **blood clots**
- Risk of second primary **malignancies**
- Dose adjustment based on kidney function

### Pomalyst\*

- **Low blood counts**
- Less **rash** than Revlimid
- Risk of second primary **malignancies**
- Risk of **blood clots**

\*Black box warning

148

# Important Considerations for Use of XPOVIO

## Gastrointestinal

Begin prophylactic anti-nausea medications. Consult with your doctor if nausea, vomiting, or diarrhea occur or persist.

## Low sodium (hyponatremia)

Maintain fluid intake. Salt tabs

## Fatigue

Stay hydrated and active.

## Low blood counts (cytopenias)

Report signs of bleeding right away. Report signs of fatigue or shortness of breath.

Chari A et al. *Clin Lymphoma Myeloma Leuk.* 2021;21:e975.

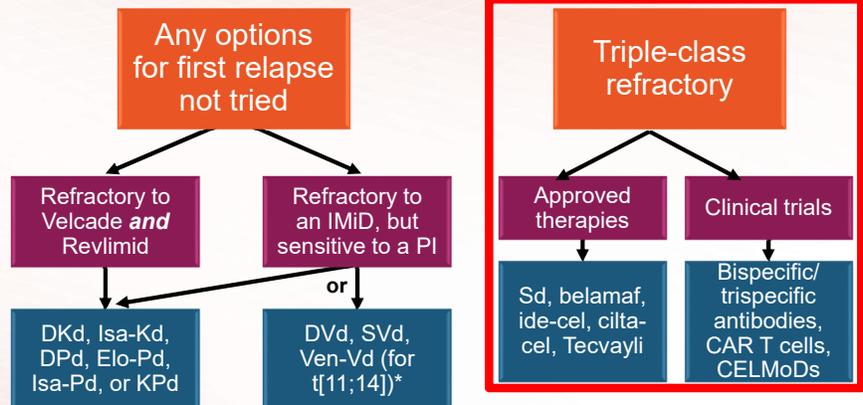

149

# Treatment Approach

## First relapse

Proteasome inhibitor/immunomodulatory drug/antibody-based therapy

## >1 Relapse

D, daratumumab (Darzalex); K, carfilzomib (Kyprolis); d, dexamethasone; Isa, isatuximab (Sarclisa); P, pomalidomide (Pomalyst); Elo, elotuzumab (Empliciti); V, bortezomib (Velcade); S, selinexor (Xpovio); Ven, venetoclax (Venclexta); belamaf, belantamab mafodotin (Blenrep); ide-cel, idecabtagene vicleucef (Abecma); cilta-cel, ciltacabtagene autoleucef (Carvykti)

\*Not yet approved for use in myeloma patients.

150

## Triple-Class Refractory

- For patients with relapsed or refractory multiple myeloma who have received treatment with—and did not respond satisfactorily to, or progressed while on treatment with—the three main classes of drugs currently used to treat myeloma are...

| Proteasome inhibitors  | Immunomodulatory drugs   | Anti-CD38 monoclonal antibodies   |
|--|--|---|
| <ul style="list-style-type: none"> <li>Velcade (bortezomib)</li> <li>Kyprolis (carfilzomib)</li> <li>Ninlaro (ixazomib)</li> </ul> | <ul style="list-style-type: none"> <li>Revlimid (lenalidomide)</li> <li>Pomalyst (pomalidomide)</li> </ul> | <ul style="list-style-type: none"> <li>Darzalex (daratumumab)</li> <li>Sarclisa (isatuximab)</li> </ul> |

151

## Currently Available Drugs for Triple-Class Refractory Myeloma

| Class                                  | Drug                                  | Formulation   | Approval  |
|--|---------------------------------------|---|---|
| Nuclear export inhibitor               | XPOVIO (selinexor)                    | Twice-weekly pill   | • For <b>relapsed/refractory</b> myeloma in combination with dexamethasone (after at least 4 prior therapies and whose disease is refractory to at least 2 PIs, at least 2 IMiDs, and an anti-CD38 mAb) |
| Chimeric antigen receptor (CAR) T cell | Abecma (idecabtagene vicleucel)*      | 300 to 460 × 10 <sup>6</sup> genetically modified autologous CAR T cells in one or more infusion bags | • For <b>relapsed/refractory</b> myeloma (after 4 or more prior lines of therapy, including an IMiD, a PI, and an anti-CD38 mAb)  |
| CAR T cell                             | Carvykti (ciltacabtagene autoleucel)† | 0.5 to 1.0 × 10 <sup>6</sup> genetically modified autologous CAR T cells/kg of body weight            | • For <b>relapsed/refractory</b> myeloma (after 4 or more prior lines of therapy, including a PI, an IMiD, and an anti-CD38 mAb)  |
| Bispecific antibody                    | Tecvyli (teclistamab)‡                | Step-up dosing§ the first week then once weekly thereafter by subcutaneous injection                  | • For <b>relapsed/ refractory</b> myeloma (after 4 or more prior lines of therapy, including an IMiD, a PI, and an anti-CD38 mAb)   |

IMiD, immunomodulatory agent; PI, proteasome inhibitor; mAb, monoclonal antibody

\*Black box warning: cytokine release syndrome; neurologic toxicities; hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLH/MAS); prolonged cytopenia

†Black box warning: cytokine release syndrome; neurologic toxicities; Parkinsonism and Guillain-Barré syndrome; hemophagocytic lymphohistiocytosis/macrophage activation syndrome (HLH/MAS); prolonged cytopenia

‡Black box warning: cytokine release syndrome; neurologic toxicities

§Patients are hospitalized for 48 hours after administration of all step-up doses.

Abecma, Carvykti, and Tecvyli are available only through a restricted distribution program.

152

# XPOVIO + Dexamethasone in Relapsed/Refractory Myeloma

|  | No. patients with $\geq$ PR (%) <sup>1</sup> |
|--|--|
| <b>Total</b>   | 32 (26)                                      |
| <b>Previous therapies to which the disease was refractory, n (%)</b> |  |
| Velcade, Kyprolis, Revlimid, Pomalyst, and Darzalex                  | 21 (25)                                      |
| Kyprolis, Revlimid, Pomalyst, and Darzalex                           | 26 (26)                                      |
| Velcade, Kyprolis, Pomalyst, and Darzalex                            | 25 (27)                                      |
| Kyprolis, Pomalyst, and Darzalex                                     | 31 (26)                                      |

**Additional analyses showed clinical benefit with XPOVIO regardless of patient age and kidney function.<sup>2,3</sup>**

153

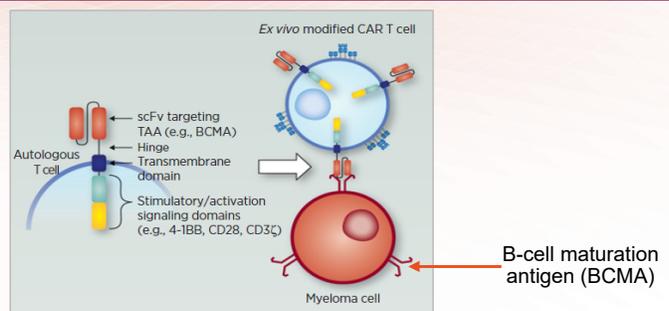

# CAR T-Cell Therapy

Genetically modified T cells designed to recognize specific proteins on MM cells

CAR T cells are activated once in contact with the MM cell and can destroy the MM cell

CAR T cells can persist for long periods of time in the body

CAR T cells are created from a patient's own blood cells, but the technology is evolving to develop "off-the-shelf" varieties

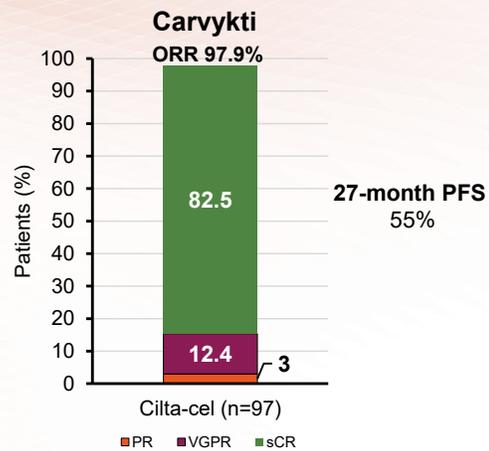

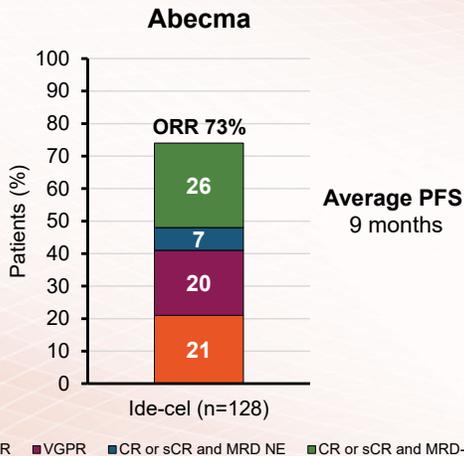

- Examples:
- Abecma (ide-cel)
  - Carvykti (cilta-cel)
  - CT103A
  - Gamma secretase inhibitor followed by CAR T-cells

CAR, chimeric antigen receptor; MM, multiple myeloma  
Cohen A et al. *Clin Cancer Res*. 2020;26:1541.

154

## Abecma and Carvykti in Relapsed and Refractory Multiple Myeloma

ORR, overall response rate; PR, partial response; VGPR, very good partial response; CR, complete response; sCR, stringent complete response; MRD, minimal residual disease; PFS, progression-free survival  
 KarMMa Trial. Munshi NC et al. *N Engl J Med.* 2021;384:705.  
 CARTITUDE-1 Trial. Berdeja JG et al. *Lancet.* 2021;398:314; Martin T et al. *J Clin Oncol.* June 4, 2022 [Epub ahead of print].

155

## CAR T: Expected Toxicities

**Cytokine release syndrome (CRS)**

**Neurotoxicity (ICANS)**

**Cytopenias**

**Infections**

|                   | CRS   | ICANS   |
|-------------------|---|---|
| <b>Onset</b>      | 1–9 days after CAR T-cell infusion  | 2–9 days after CAR T-cell infusion  |
| <b>Duration</b>   | 5–11 days   | 3–17 days   |
| <b>Symptoms</b>   | <ul style="list-style-type: none"> <li>Fever</li> <li>Difficulty breathing</li> <li>Dizziness</li> <li>Nausea</li> <li>Headache</li> <li>Rapid heartbeat</li> <li>Low blood pressure</li> </ul> | <ul style="list-style-type: none"> <li>Headache</li> <li>Confusion</li> <li>Language disturbance</li> <li>Seizures</li> <li>Delirium</li> <li>Cerebral edema</li> </ul> |
| <b>Management</b> | <ul style="list-style-type: none"> <li>Actemra (tocilizumab)</li> <li>Corticosteroids</li> <li>Supportive care</li> </ul>   | <ul style="list-style-type: none"> <li>Antiseizure medications</li> <li>Corticosteroids</li> </ul>  |

\*Based on the ASTCT consensus; †Based on vasopressor; ‡For adults and children >12 years; §For children ≤12 years; ¶Only when concurrent with CRS

ICANS, immune effector cell-associated neurotoxicity syndrome  
 Xiao X et al. *J Exp Clin Cancer Res.* 2021;40(1):367. Lee DW et al. *Biol Blood Marrow Transplant.* 2019;25:625;  
 Shah N et al. *J Immunother Cancer.* 2020;8:e000734.

156

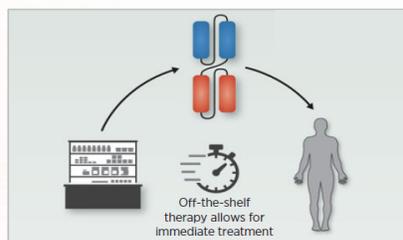

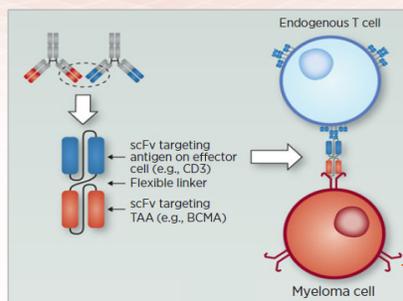

# Bispecific Antibodies

Bispecific antibodies are also referred to as *dual specific antibodies*, *bifunctional antibodies*, or *T-cell engaging antibodies*

Bispecific antibodies can target two cell surface molecules at the same time (one on the myeloma cell and one on a T cell)

Many different bispecific antibodies are in clinical development; none are approved for use in myeloma

Availability is off-the-shelf, allowing for immediate treatment

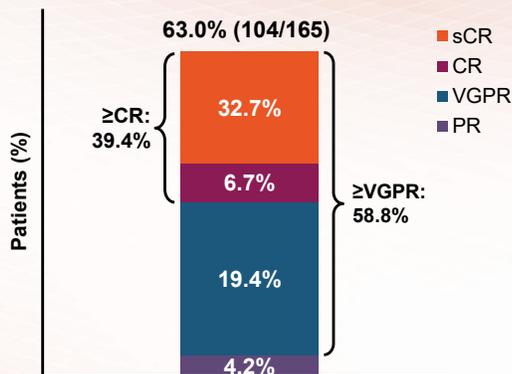

- Examples:
- Elranatamab
  - Teclistamab
  - TNB-303B (ABBV-383)
  - Linvoseltamab
  - Alnuctamab
  - Cevostamab
  - Talquetamab

Cohen A et al. *Clin Cancer Res.* 2020;26:1541.

157

# Now Approved: Tecvayli, the First Bispecific Antibody!

Median duration of response  
 18.4 months

Moreau P et al. *N Engl J Med.* 2022;387:495.

158

## Tecvayli Side Effects

### Side Effects

- Cytokine release syndrome
- Injection-related reactions
- Injection-site reaction
- Infections
- Neutropenia
- Anemia
- Thrombocytopenia
- Neurotoxicity

### Side Effect Management

- Available only through a Risk Evaluation and Mitigation Strategies (REMS) due to the risk of cytokine release syndrome
- Patients will receive step-up dosing and will be monitored in an inpatient setting
- Cytokine release syndrome is managed in the same fashion as CAR T
- Injection reactions are managed with oral antihistamines and topical steroids
- Infection prevention!
- COVID precautions

159

## Similarities and Differences Between CAR T-Cell Therapy and Bispecific Antibodies

|                                  | CAR T-cell therapy  | Bispecific antibody  |
|----------------------------------|---|--|
| <b>Approved product</b>          | Abecma, Carvykti  | Tecvayli   |
| <b>Efficacy</b>                  | ++++  | +++  |
| <b>How given</b>                 | One-and-done  | IV or SC, weekly to every 3 weeks until progression  |
| <b>Where given</b>               | Academic medical centers  | Academic medical centers   |
| <b>Notable adverse events</b>    | CRS and neurotoxicity   | CRS and neurotoxicity  |
| <b>Cytokine release syndrome</b> | +++   | ++   |
| <b>Neurotoxicity</b>             | ++  | +  |
| <b>Availability</b>              | Wait time for manufacturing   | Off-the-shelf, close monitoring for CRS and neurotoxicity  |
| <b>Advantages</b>                | <ul style="list-style-type: none"> <li>• Personalized</li> <li>• Targeted immunocytotoxicity</li> <li>• Single infusion (“one and done”)</li> <li>• Potentially persistent</li> </ul>   | <ul style="list-style-type: none"> <li>• Off the shelf</li> <li>• Targeted immunocytotoxicity</li> <li>• No lymphodepletion</li> <li>• Minimal steroids</li> </ul>   |
| <b>Disadvantages</b>             | <ul style="list-style-type: none"> <li>• FACT-accredited center required (hospitalization likely required)</li> <li>• CRS and neurotoxicity; requires ICU and neurology services</li> <li>• Dependent on T-cell health (manufacturing failures)</li> <li>• Requires significant social support; caregiver required</li> <li>• \$\$\$\$</li> </ul> | <ul style="list-style-type: none"> <li>• Initial hospitalization required</li> <li>• CRS and neurotoxicity possible</li> <li>• Dependent on T-cell health (T-cell exhaustion)</li> <li>• Requires continuous administration</li> <li>• \$\$\$</li> </ul> |

160

## Emerging Treatment Options

Cereblon E3 ligase  
modulators (CELMoDs)

Immunocytokines

More bispecific  
antibodies (BCMA,  
GCPR5D, Fc5H targets)

More chimeric antigen  
receptor (CAR) T-cell  
therapies

161

## Summary

- We now have many different options for relapsed myeloma depending on patient and myeloma factors at relapse.
- Therapy choices will depend on teamwork between physician, patient, and caregivers and are based on many decision points.
- Combinations of proteasome inhibitors with either immunomodulatory drugs or selinexor improve progression-free survival.
- We have three different monoclonal antibodies that improve progression-free survival when added to other standard therapies without significantly increasing side effects.
- CAR T and bispecific antibodies are very active even in heavily pre-treated patients. Many other exciting immunotherapy options are in trials and look very promising.

## A Cancer Patient and Caregiver's Journey

**Cancer Caregiving: Its challenges and  
celebrations.  
An intimate conversation with the  
England Family**

### **Objective**

**A look at a cancer caregiving experience  
and the importance of enhancing the skills  
and knowledge of the cancer caregivers.**

164

## Cancer Caregivers of America

# Cancer Caregivers Education Platform

Online Training, Resources, and a Cancer Care Community

165

## HOW DID WE GET HERE?

### Our Journey

Jack Kavanagh diagnosed with Multiple Myeloma (1991)

Arizona Multiple Myeloma Network Non-profit created (2004)

Cancer Caregivers AZ, Cancer Caregivers Education Program created (2014)

### WELCOME

Cancer Caregivers of America, Online Cancer Caregivers Education Platform Launch (2023)

166

## Cancer Caregivers Education The NEED

167

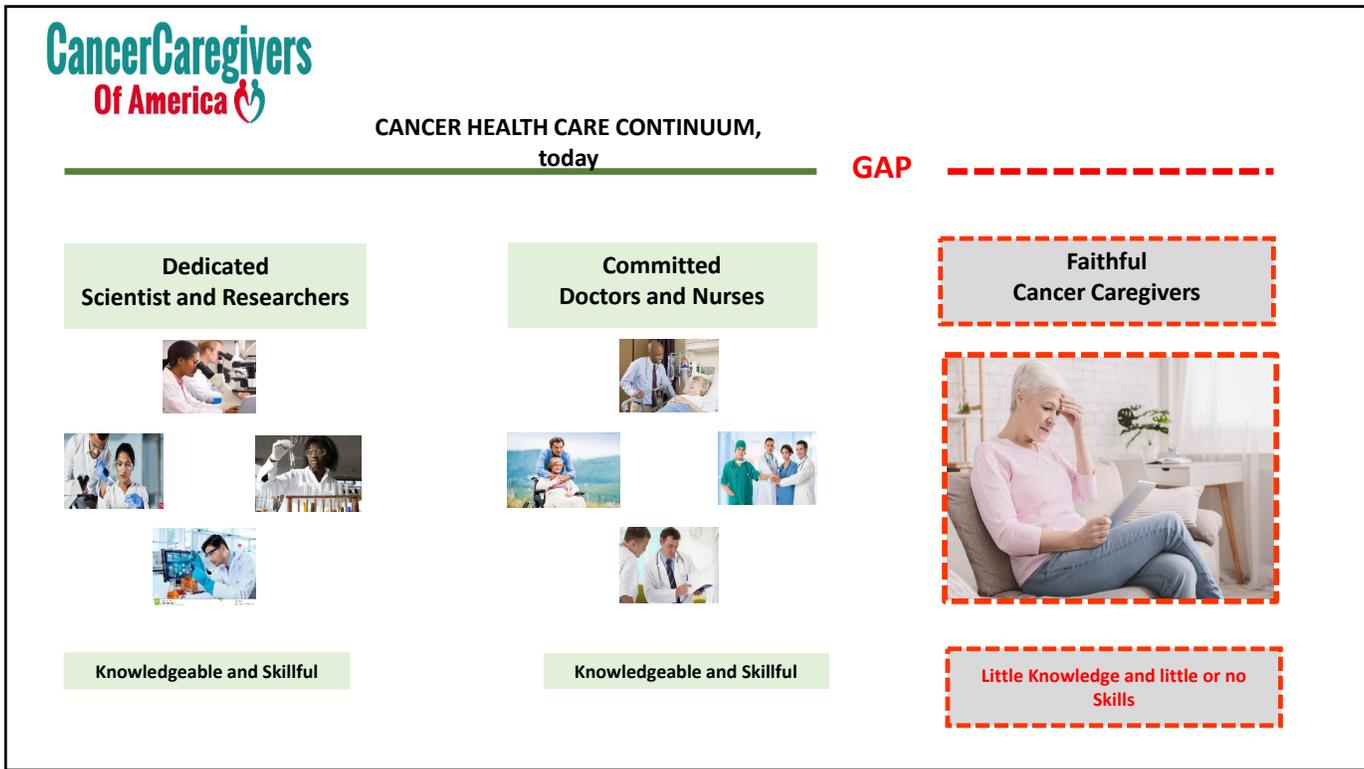

Today we **LAUNCH!!!**

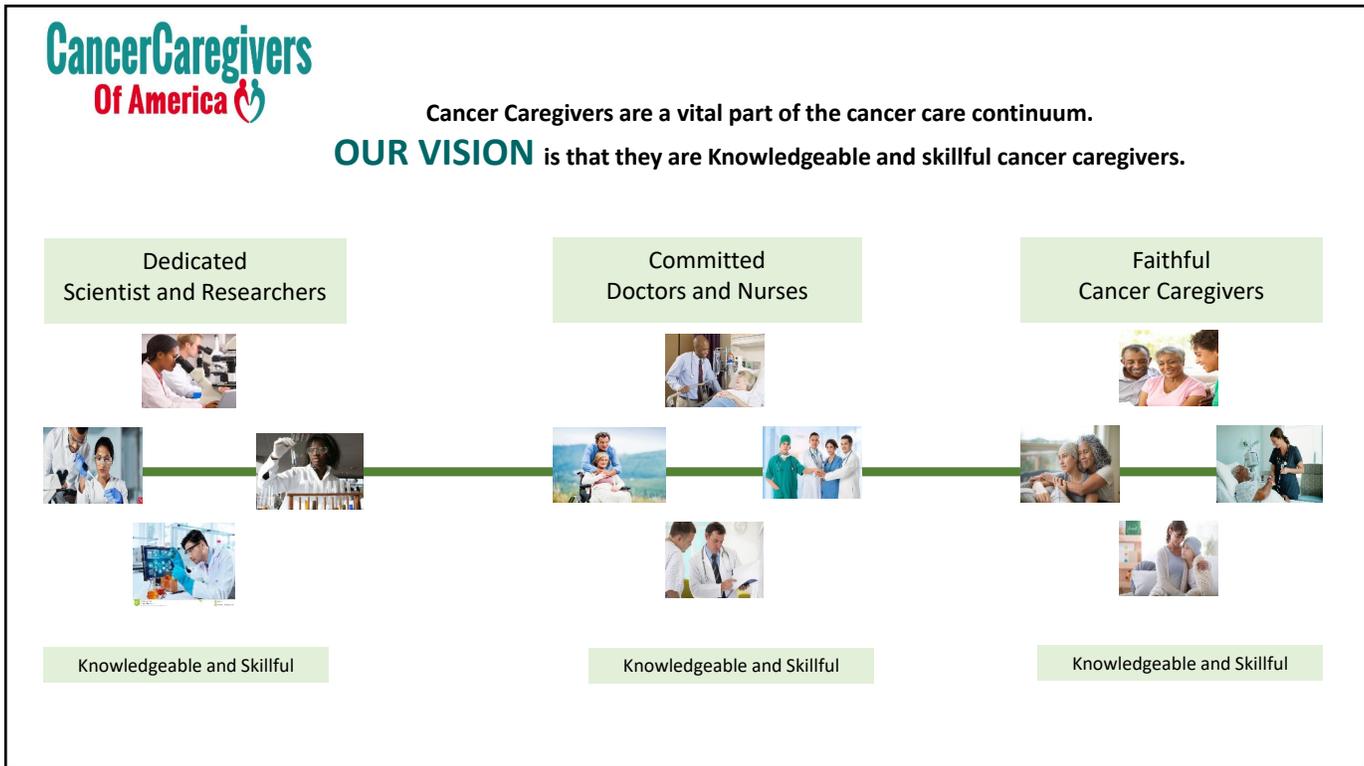

## Online Cancer Caregivers Education Platform

Available in the U.S. and Canada

168

169

170

### What is the Online Cancer Caregivers Education Platform?

Online Cancer Caregivers Education Platform includes, online Education/Training, Resources, and a Cancer Care Community  
 The program also has the option to provide In-Person Training Sessions

The program is designed for **All** **CANCERS** and **CANCER CAREGIVERS**

The program focuses on **INCREASING** your **KNOWLEDGE** and **BUILDING** your cancer caregiving **SKILLS**

The program is developed using actual Cancer Caregivers and Patients knowledge and experiences

The program is designed with a **360°** view of what the cancer caregiver and patient will experience.  
 The psychological, physical, social, emotional, financial and the many other circumstances that will arise on your journey.

171

# MMRF Patient Resources

**EXPECT GUIDANCE.**

MMRF  
Patient Navigation Center

- Information & Resources
- Expert Advice
- Support

**MMRF** MULTIPLE MYELOMA  
Research Foundation

### MMRF Patient Navigation Center

You and your care team will have many decisions to make along your treatment journey. The Patient Navigation Center is a space for multiple myeloma patients and their caregivers to connect with patient navigators – who are professionals specializing in oncology – for guidance, information, and support. You can connect with a patient navigator via phone, or email. Whatever questions you may have, our patient navigators are here to help.

MMRF Patient Navigators include:

- Grace Allison, RN, BSN, OCN, RN-BC
- Brittany Hartmann, RN-BSN
- Erin Mensching, RN-BSN, OCN

### THE RIGHT TRACK

Get on the right track for you

The MMRF's Right Track program puts you on the path to the best results for you.

| Right Team   | Right Tests  | Right Treatment  |
|--|--|--|
| Access experts and centers that have extensive experience treating multiple myeloma. | Get the information, tests, and precise diagnoses to make the right treatment decisions. | Work with your team to consider the best treatment plan and identify clinical trials that are right for you. |

Contact the Patient Navigation Center Today  
Looking for guidance? We're here to help.  
Monday - Friday | 9:00am - 7:00pm ET  
Phone: 1-888-841-MMRF (6673) | Online: [TheMMRF.org/PatientNavigationCenter](https://www.themmrff.org/PatientNavigationCenter)  
Email: [patientnavigator@themmrff.org](mailto:patientnavigator@themmrff.org)

## Myeloma Mentors®

Myeloma Mentors® allows patients and caregivers the opportunity to connect with trained mentors. This is a phone-based program offering an opportunity for a patient and/or caregiver to connect one-on-one with a trained patient and/or caregiver mentor to share his or her patient journeys and experiences.

No matter what your disease state—smoldering, newly diagnosed, or relapsed/refractory—our mentors have insights and information that can be beneficial to both patients and their caregivers.

**Contact the Patient Navigation Center at 888-841-6673  
to be connected to a Myeloma Mentor or to learn more.**
